SignalLoop

VISUAL USER GUIDE | REVENUE OS EDITION

Operate governed engagement with confidence.

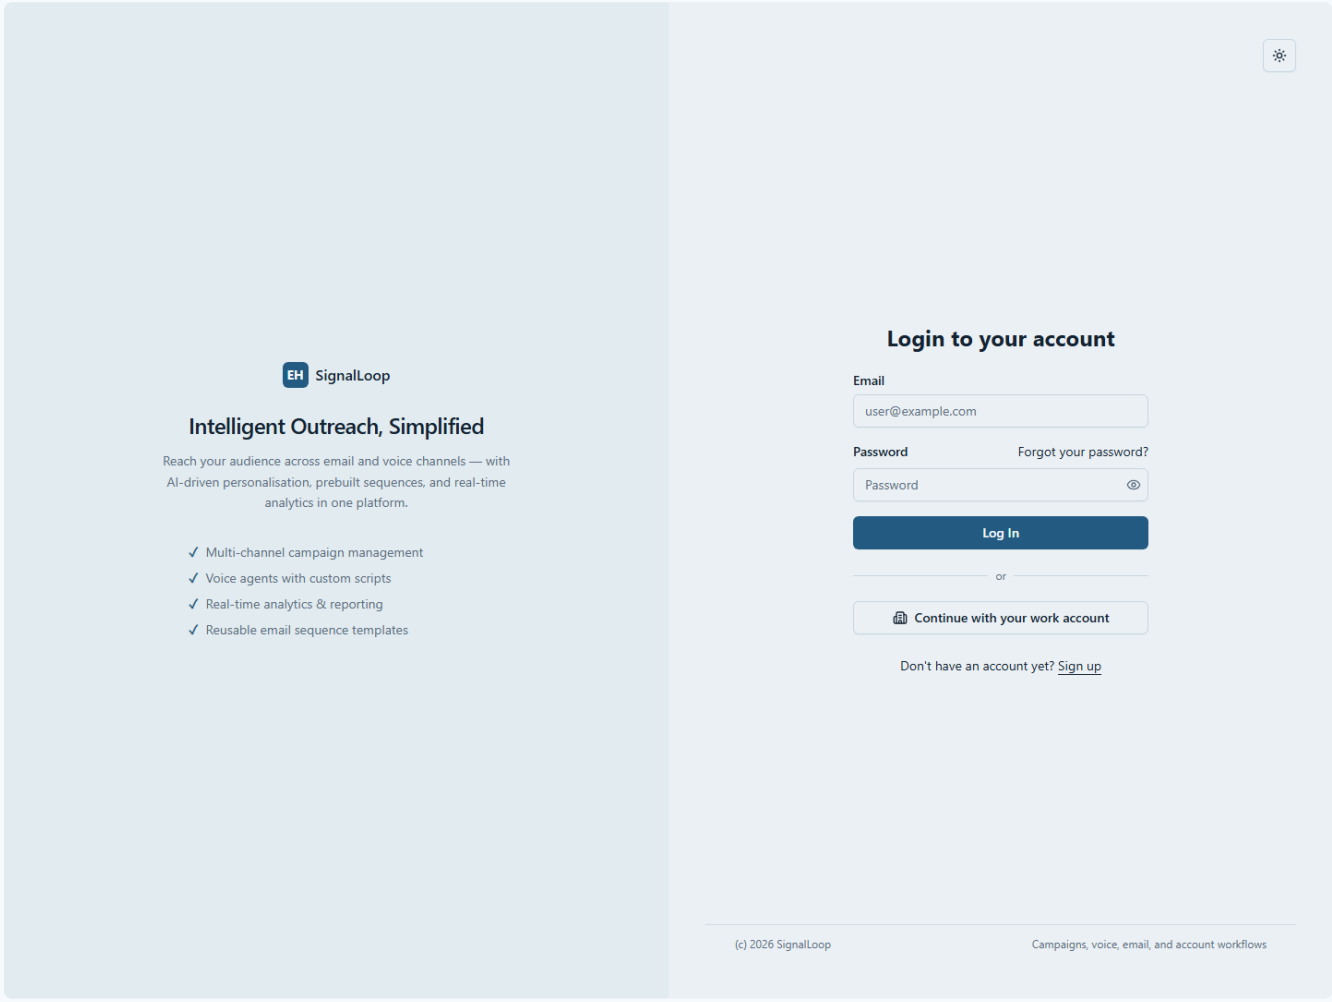

A screen-led guide to campaigns, AI lead discovery & enrichment, autonomous commercial agents, voice, messaging, customer context, enterprise controls, and the Revenue OS workspace.

For outreach operators, Messaging Hub users, tenant administrators, and platform administrators.

October 10, 2026

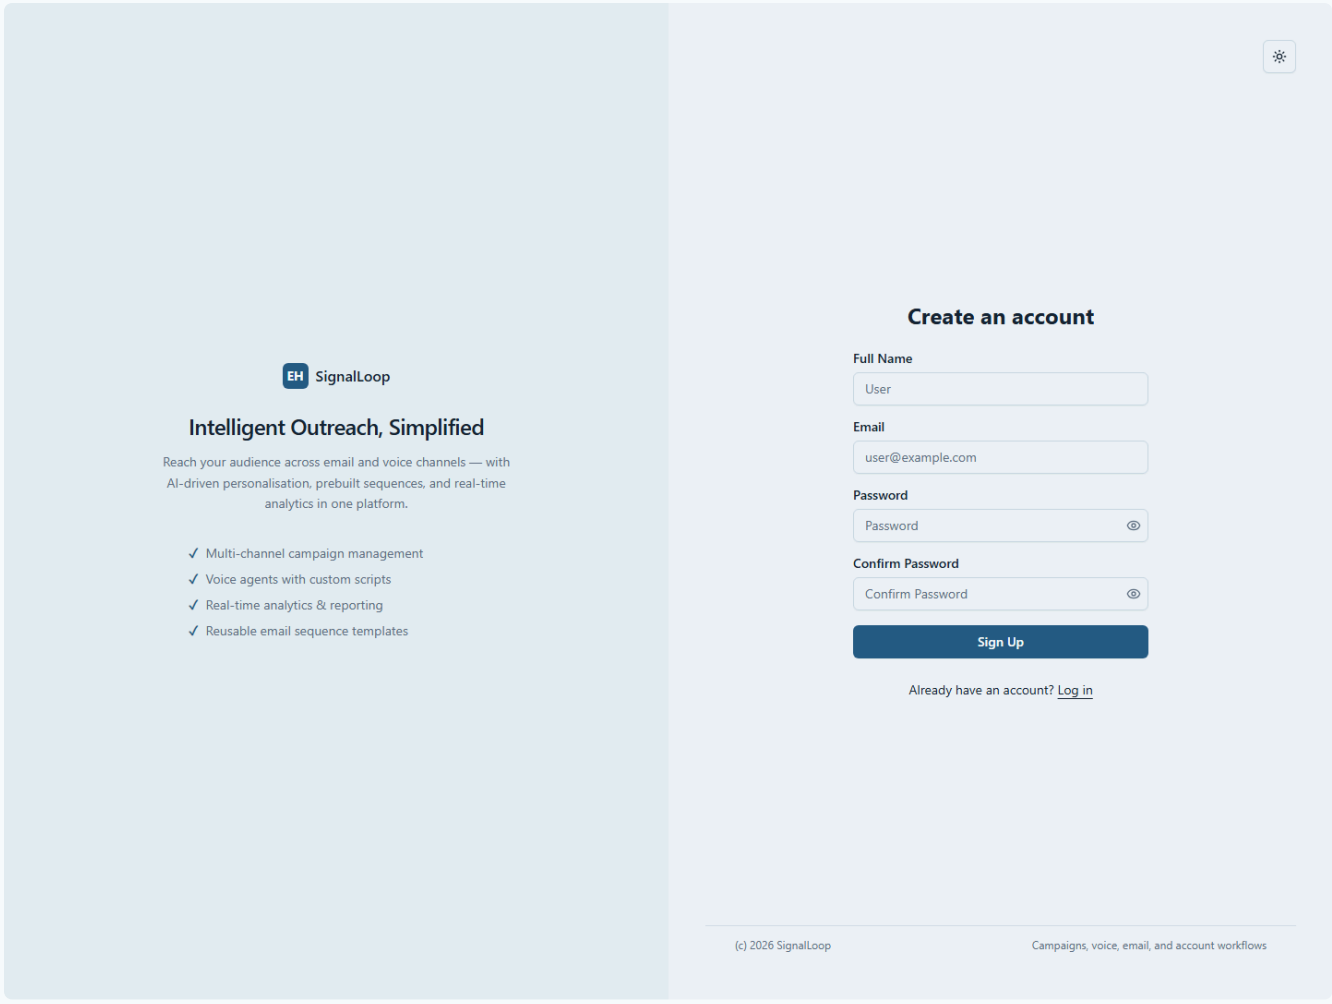

Start here

1. Open the SignalLoop URL supplied by your administrator.
2. Sign in with your work account. Use **Sign up** or **Forgot your password?** only when those actions are enabled for your deployment.
3. Confirm the workspace in the header and use the left navigation to open the needed area.
4. Start at **Dashboard** for operational status, or **Home** to choose a workspace area.

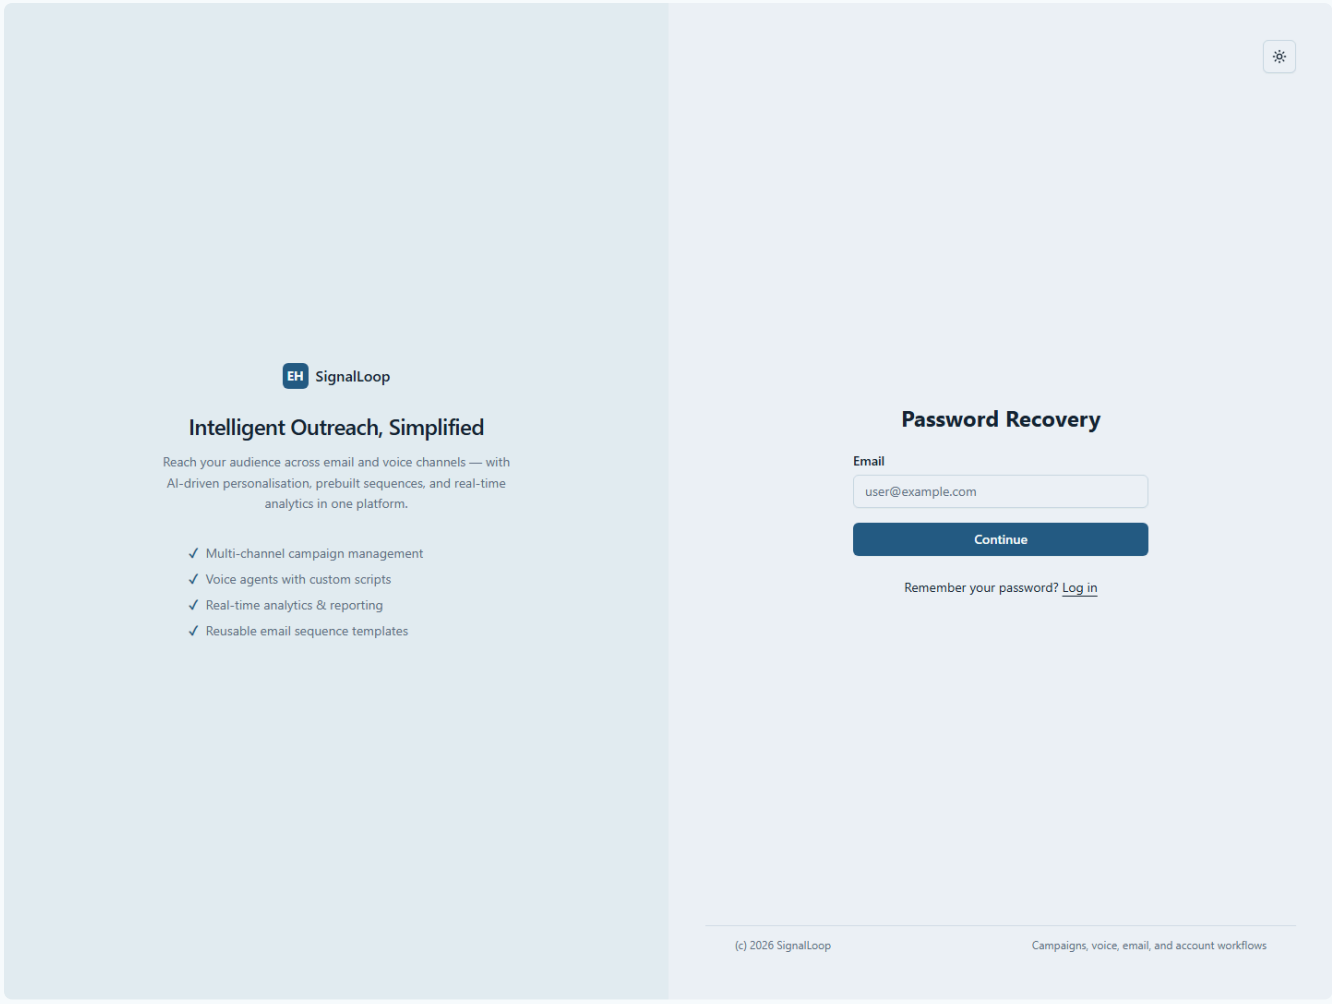

Log in

If self-service accounts are enabled for your deployment, **Sign up** collects the details needed to request workspace access.

Sign up

Forgot your password? starts email-based recovery without involving an administrator.

Password recovery

Access and roles

- **Operator or standard user** works with the outreach and Messaging Hub surfaces granted to their workspace.
- **Tenant administrator / superuser** manages tenant people, products, branding, security, messaging, provider setup, and workspace configuration.
- **Platform administrator** manages tenant lifecycle, product policy, identity, support access, and audit from the control plane. Selecting a tenant there never grants access to its business data.

The application hides or redirects restricted screens. If an area is missing, ask a tenant administrator to review your membership and role; do not work around workspace access checks.

Left-navigation modes

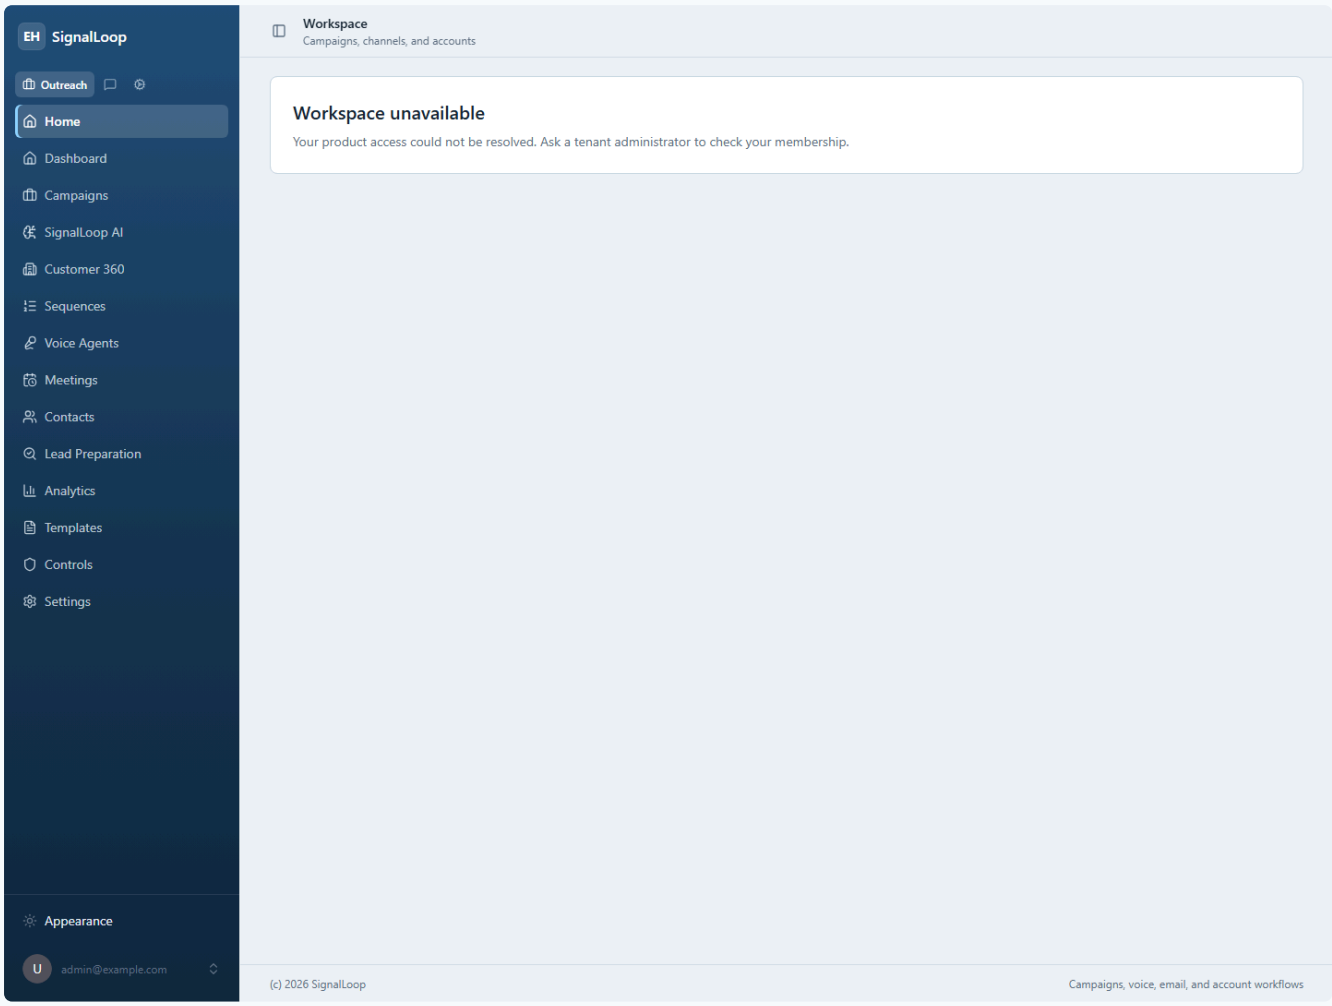

The three controls at the top of the left navigation switch the menu between product areas: **Outreach**, **Messaging**, and, for superusers, **Admin**. The inactive controls may appear as icons until selected; select one to expose its menu. The walkthroughs below follow each mode in left-to-right nav order, the way an operator would click through it.

Outreach

Switching to Outreach exposes Home, Dashboard, Campaigns, SignalLoop AI, Customer 360, Sequences, Voice Agents, Meetings, Contacts, Lead Discovery, Lead Preparation, Analytics, Templates, Controls, and Settings.

Home

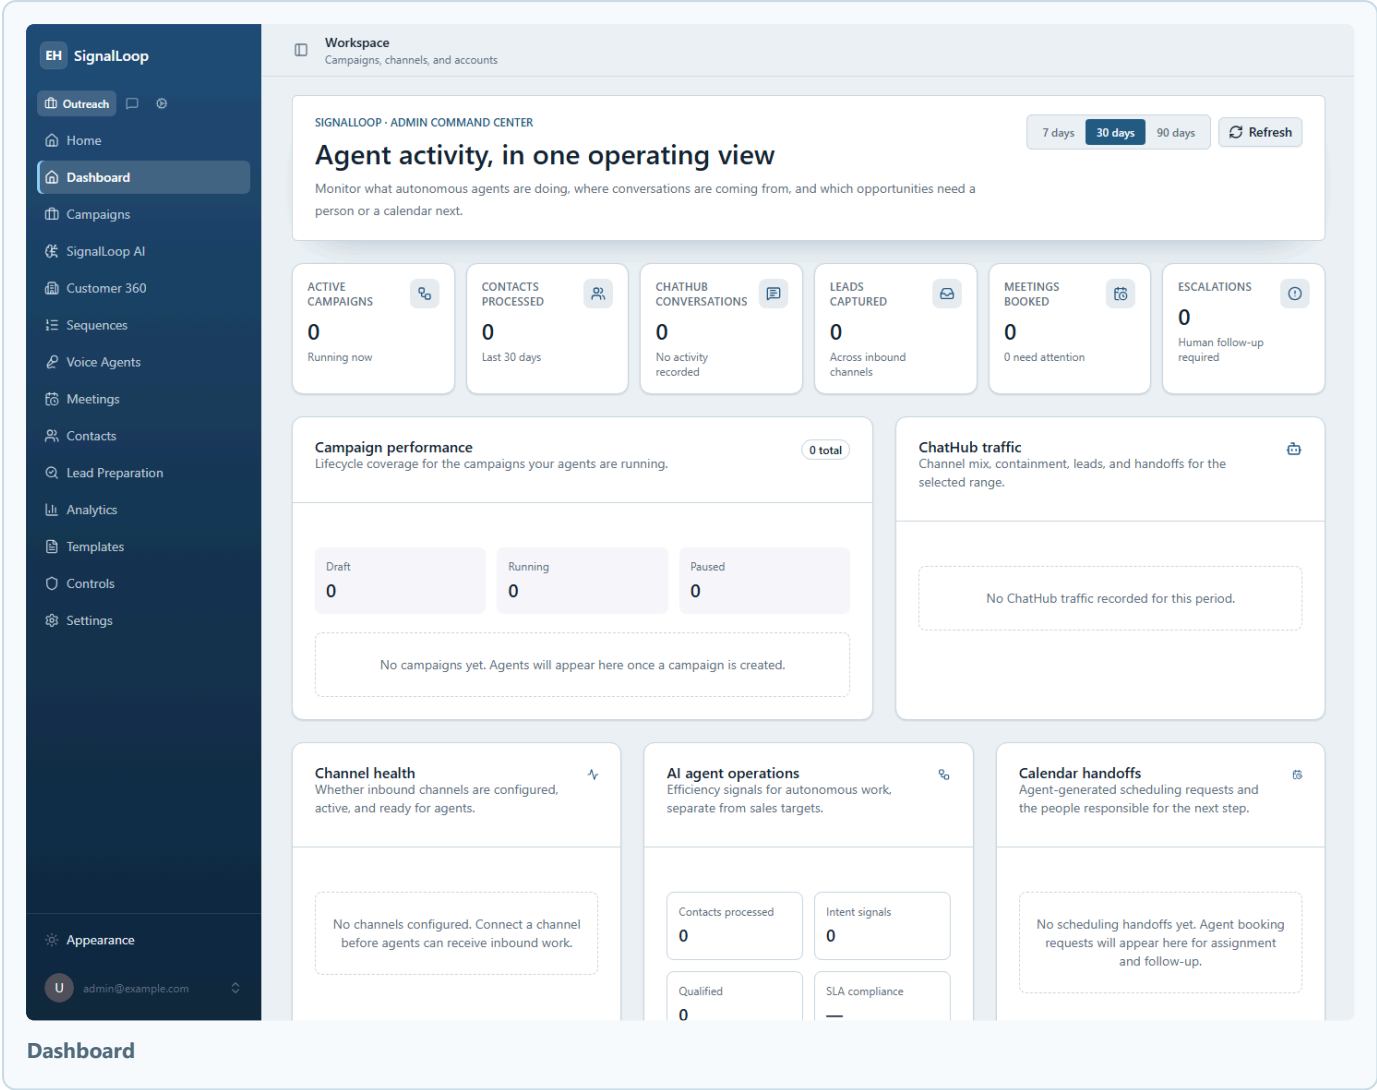

Home provides product and workflow shortcuts for choosing where to work next.

Home

Dashboard

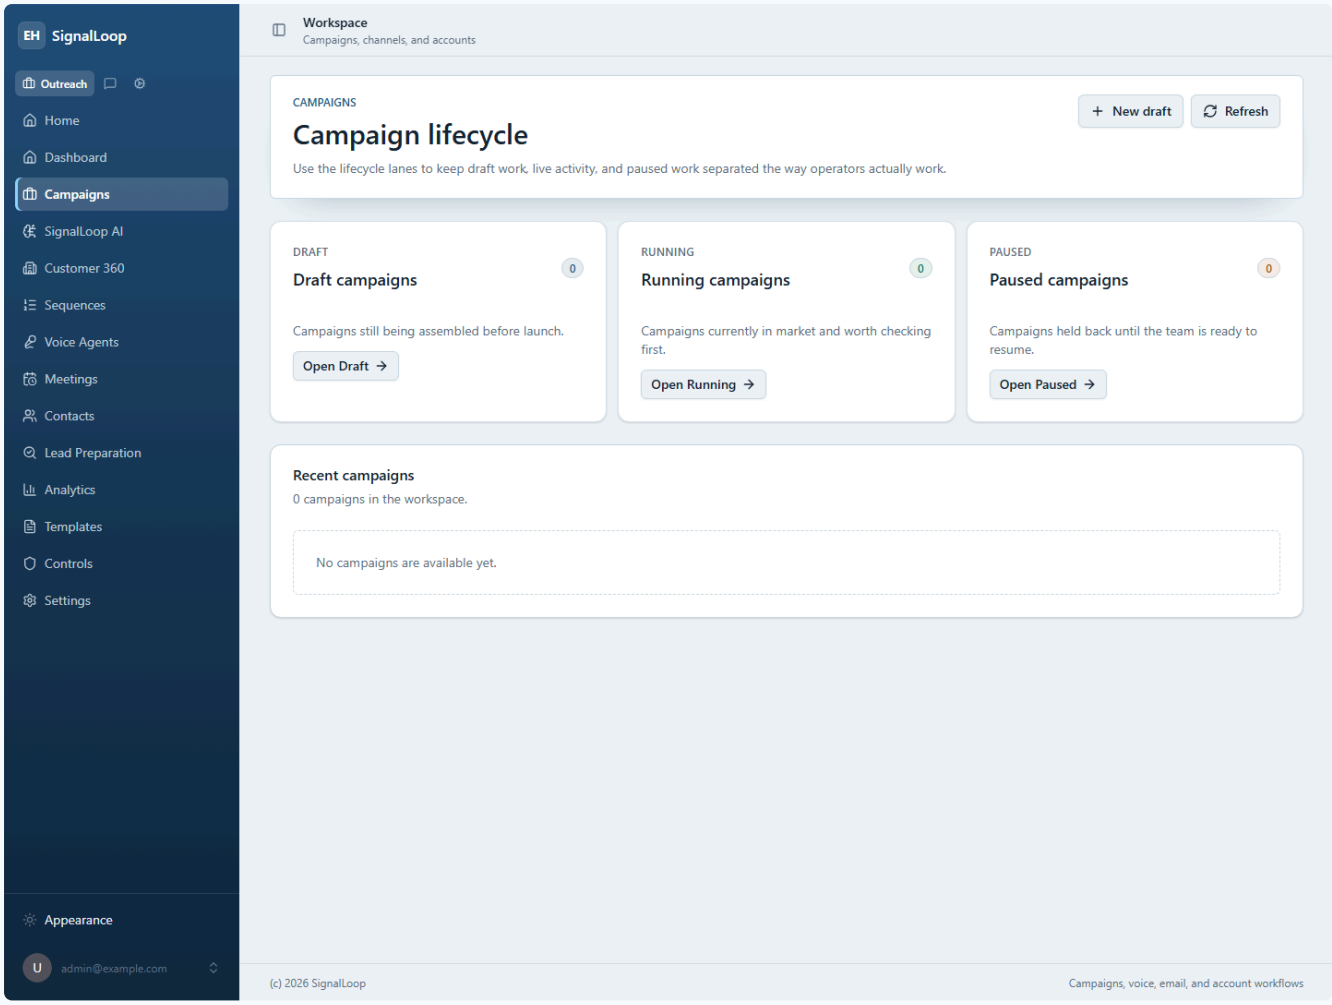

Dashboard is the operational view for campaign activity, contacts processed, Messaging Hub traffic, leads, meetings, escalations, channel health, agent operations, and calendar handoffs. Use its period selector and **Refresh** when reviewing current activity. Empty-state cards are normal in a new or unconnected workspace; they do not prove that a provider or worker is ready.

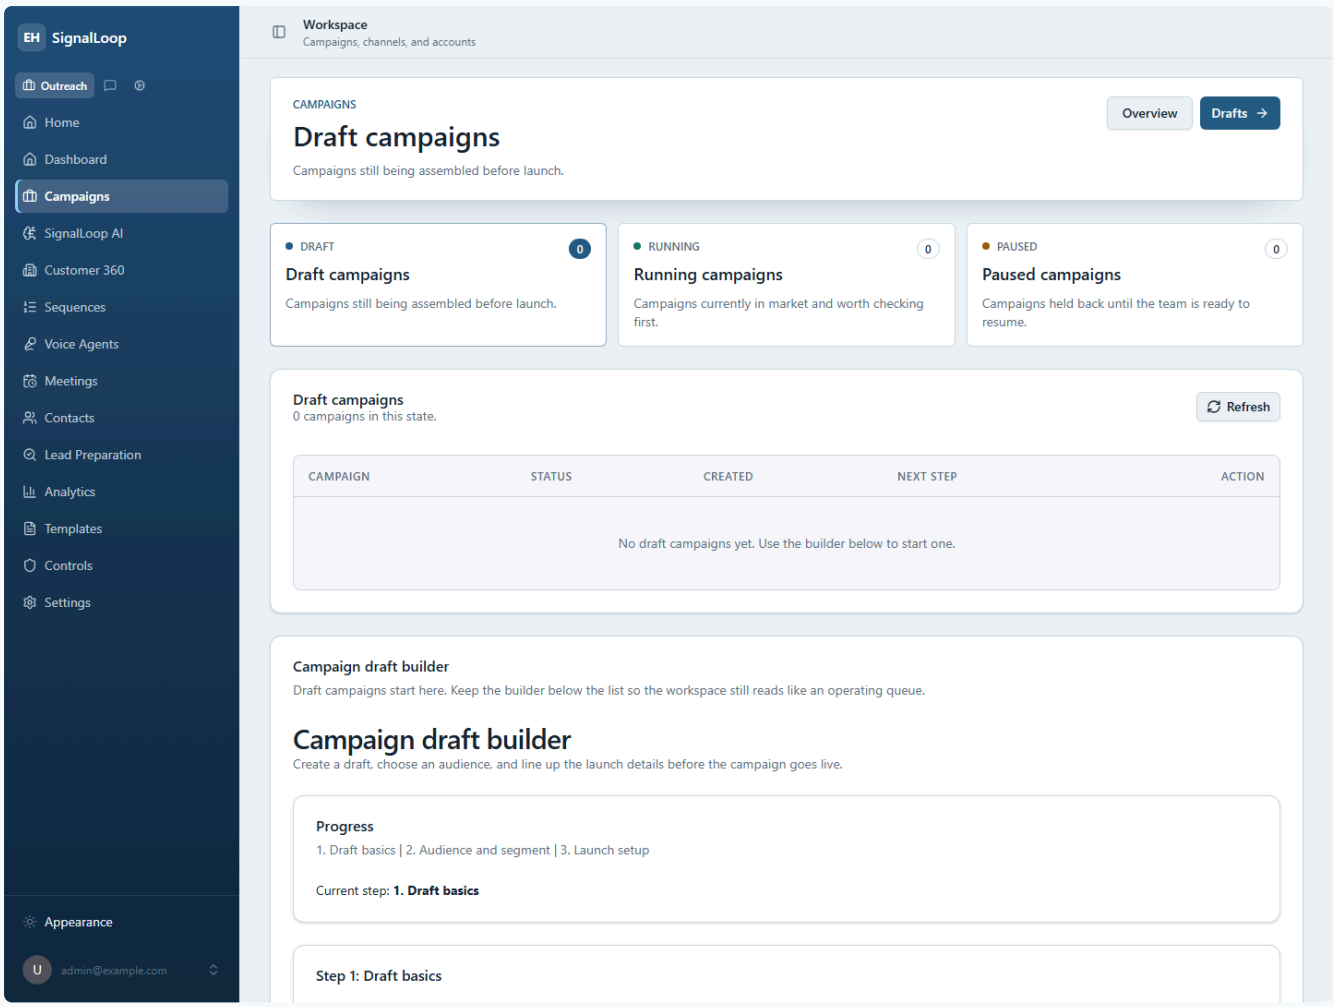

Dashboard

Campaigns

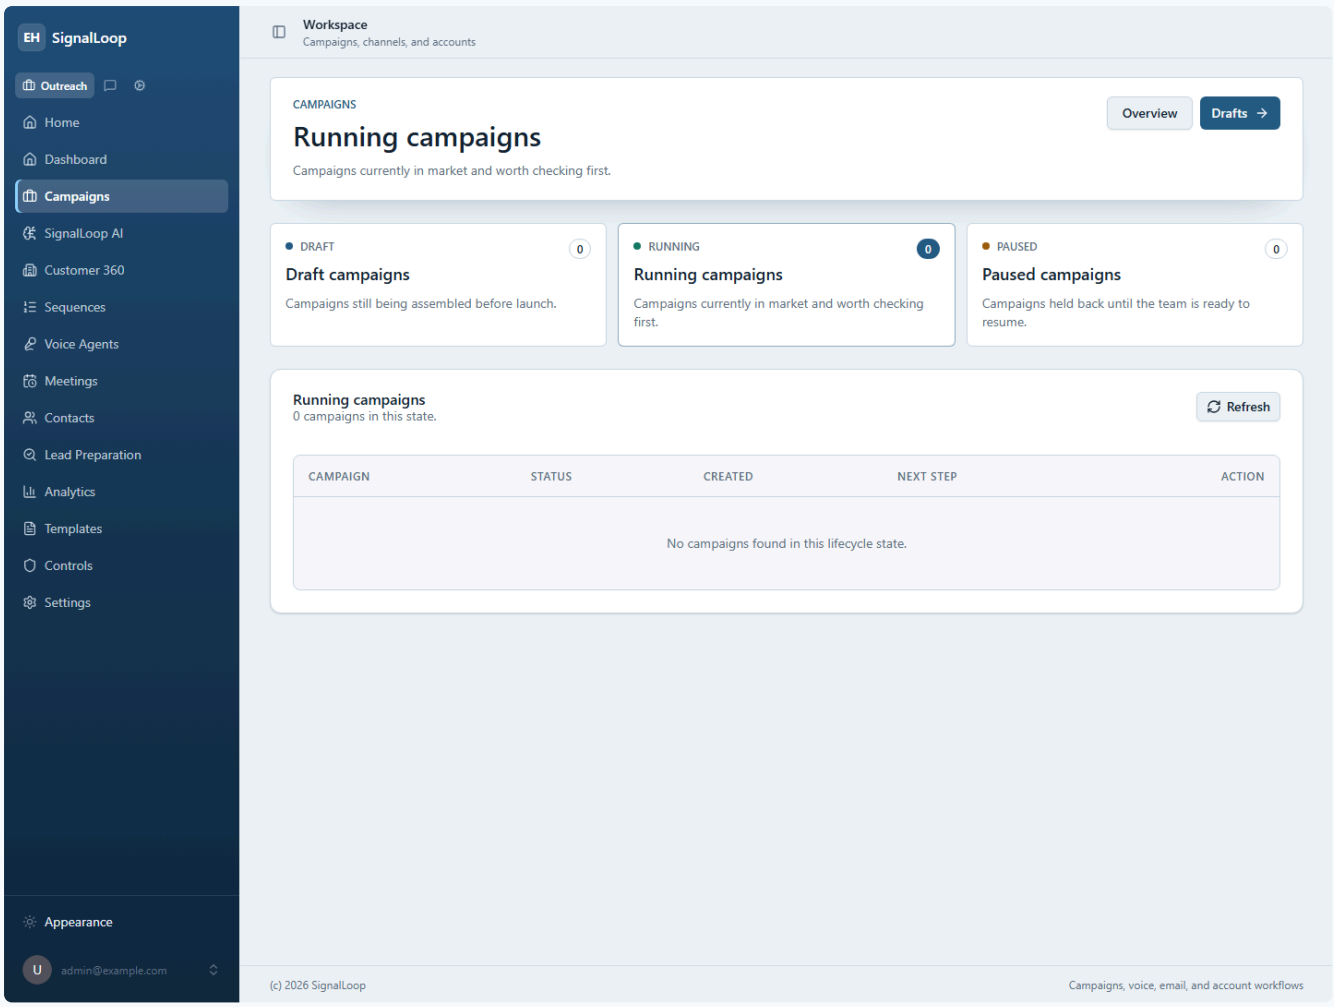

Campaigns has campaign work plus **Draft**, **Running**, and **Paused** lifecycle views. Start with a draft, review audience and channel strategy, then monitor its status.

Paused campaigns

SignalLoop AI

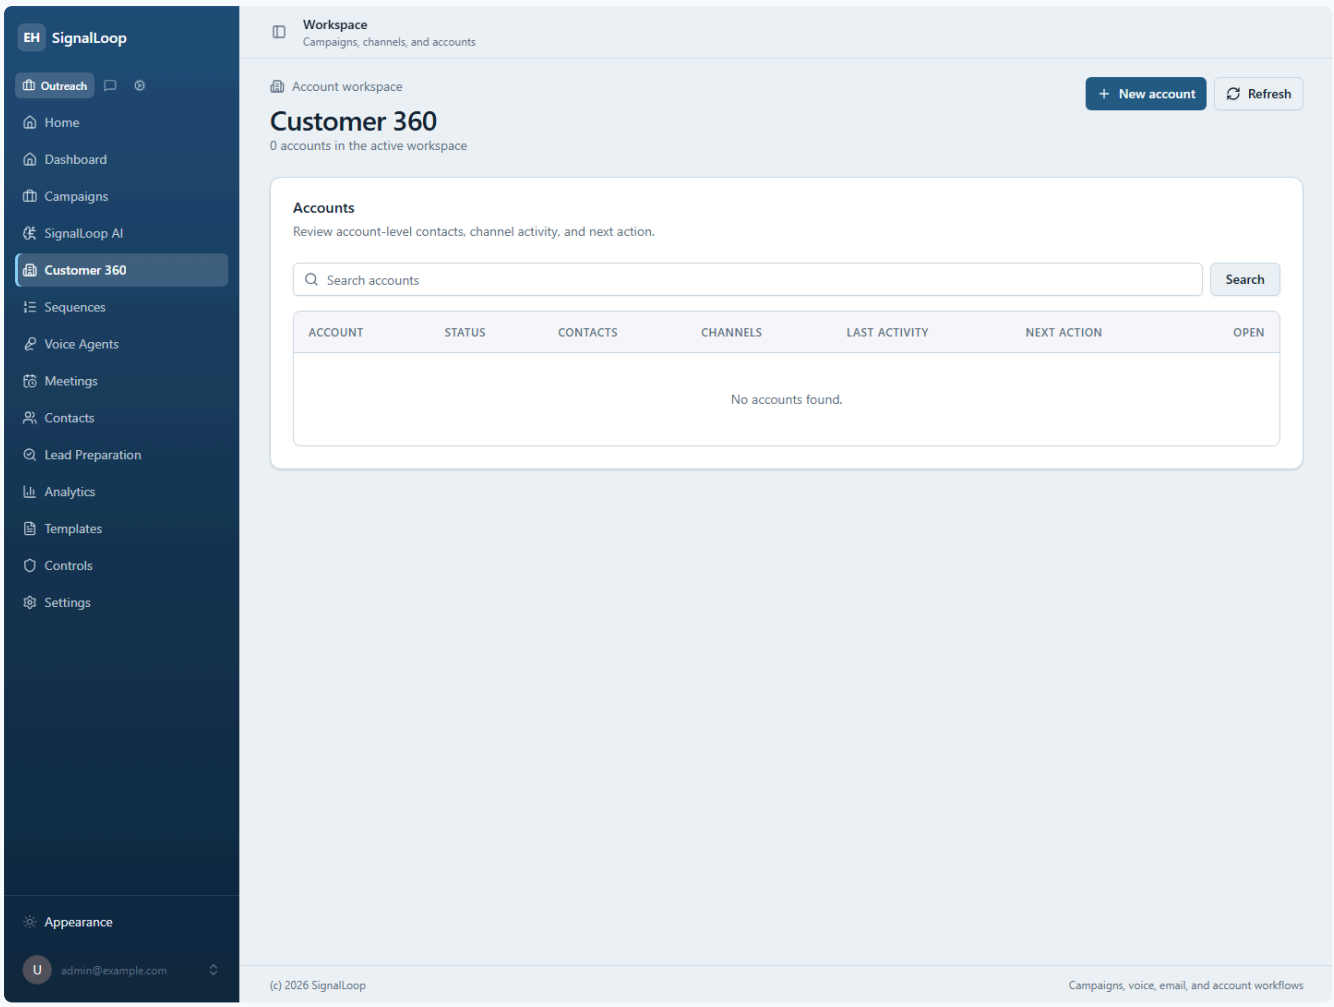

SignalLoop AI groups next best actions, a unified work queue, journey signals, and knowledge gaps.

SignalLoop AI

Customer 360

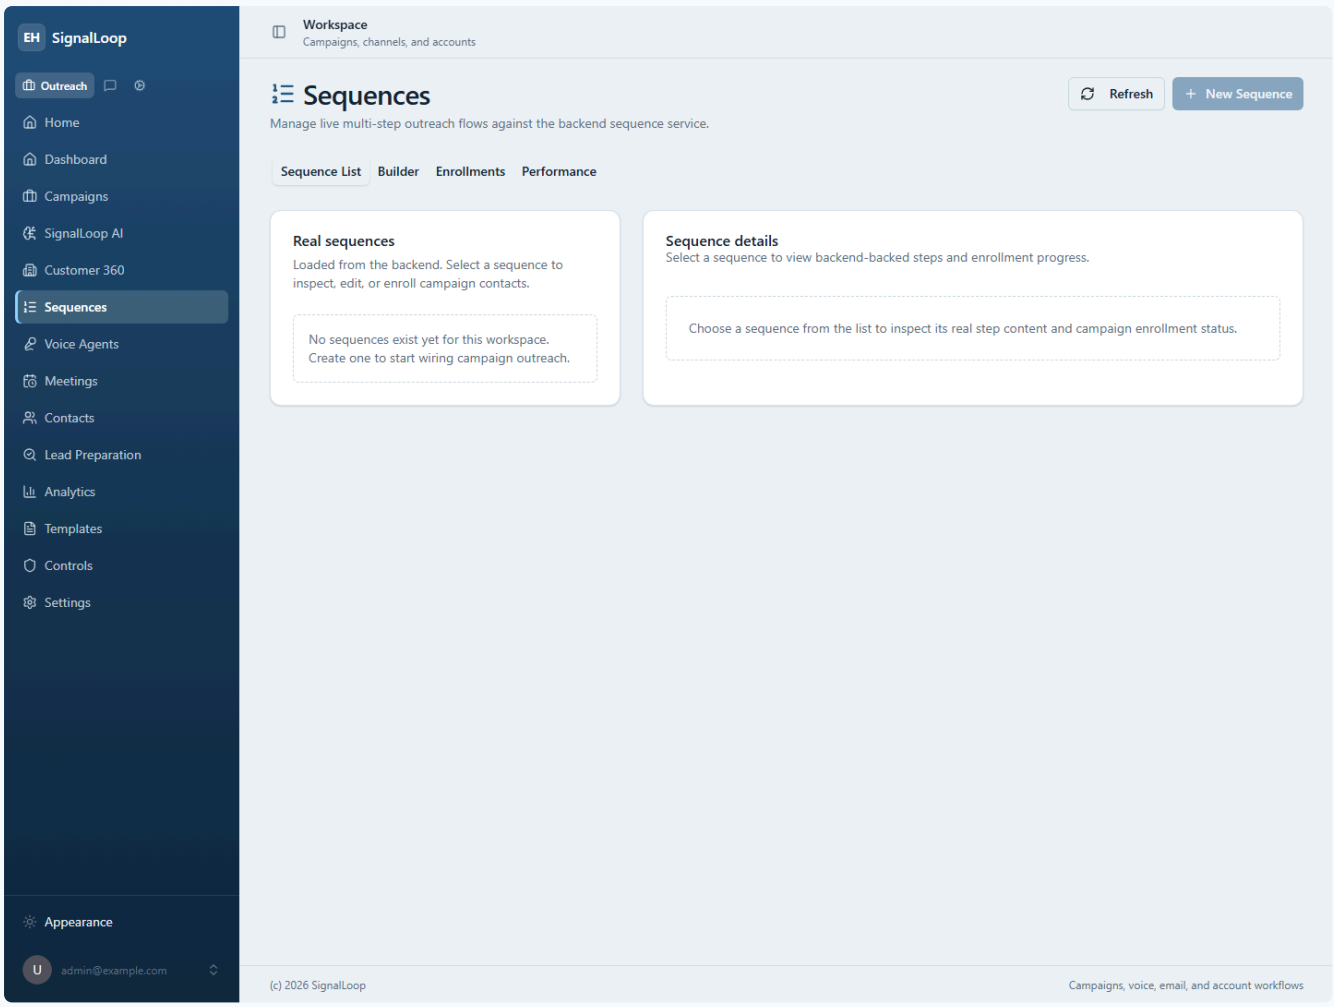

Customer 360 is the account workspace for contacts, channel activity, and next action.

Customer 360

Sequences

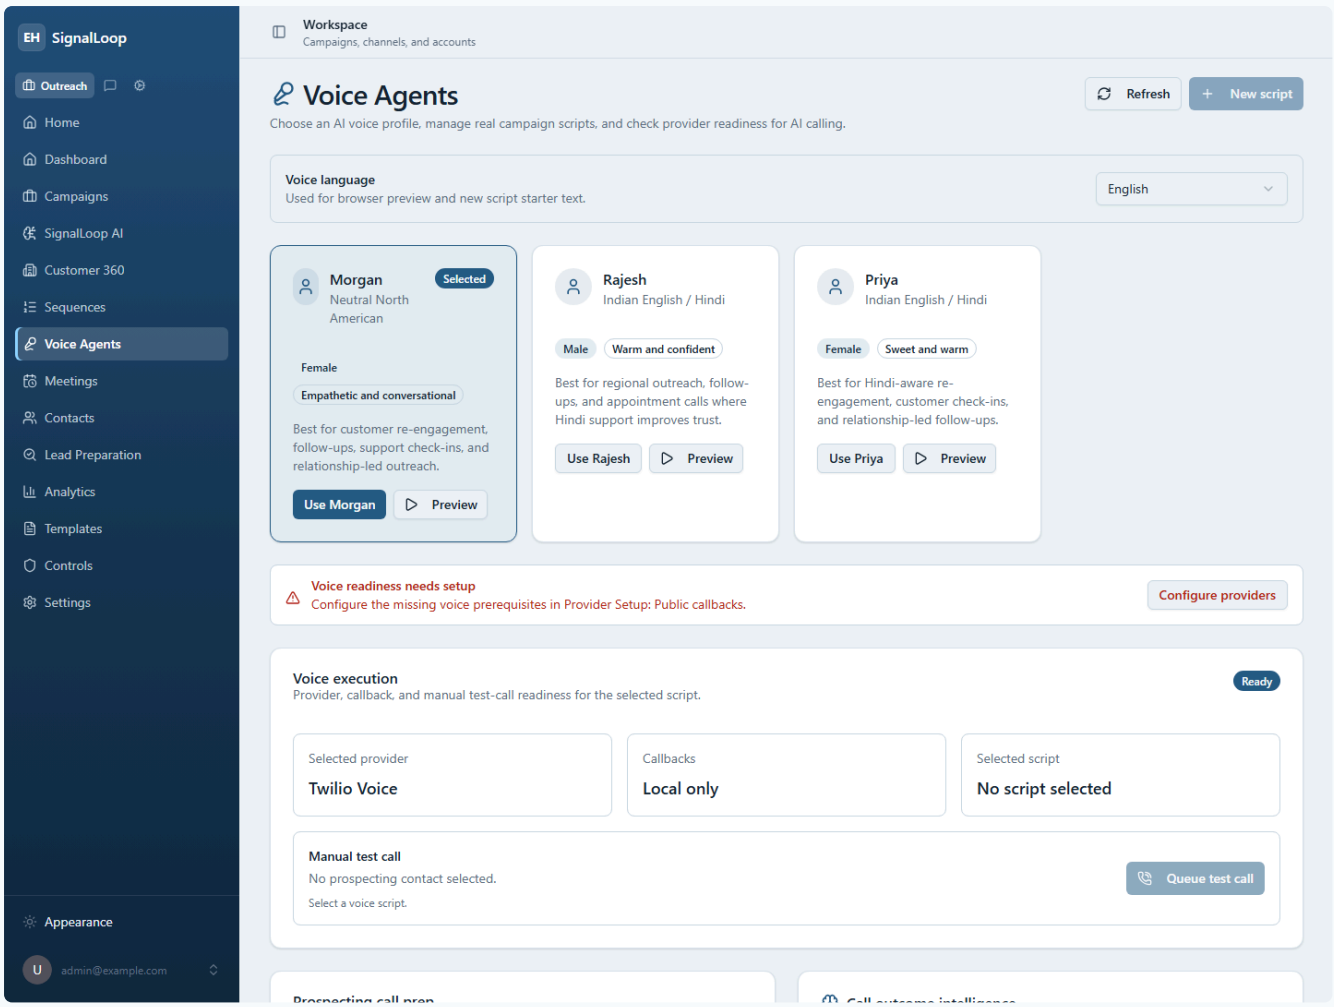

Sequences is the multi-step outreach surface. Create or select a sequence, inspect its steps, then review enrollments and performance.

Sequences

Voice Agents

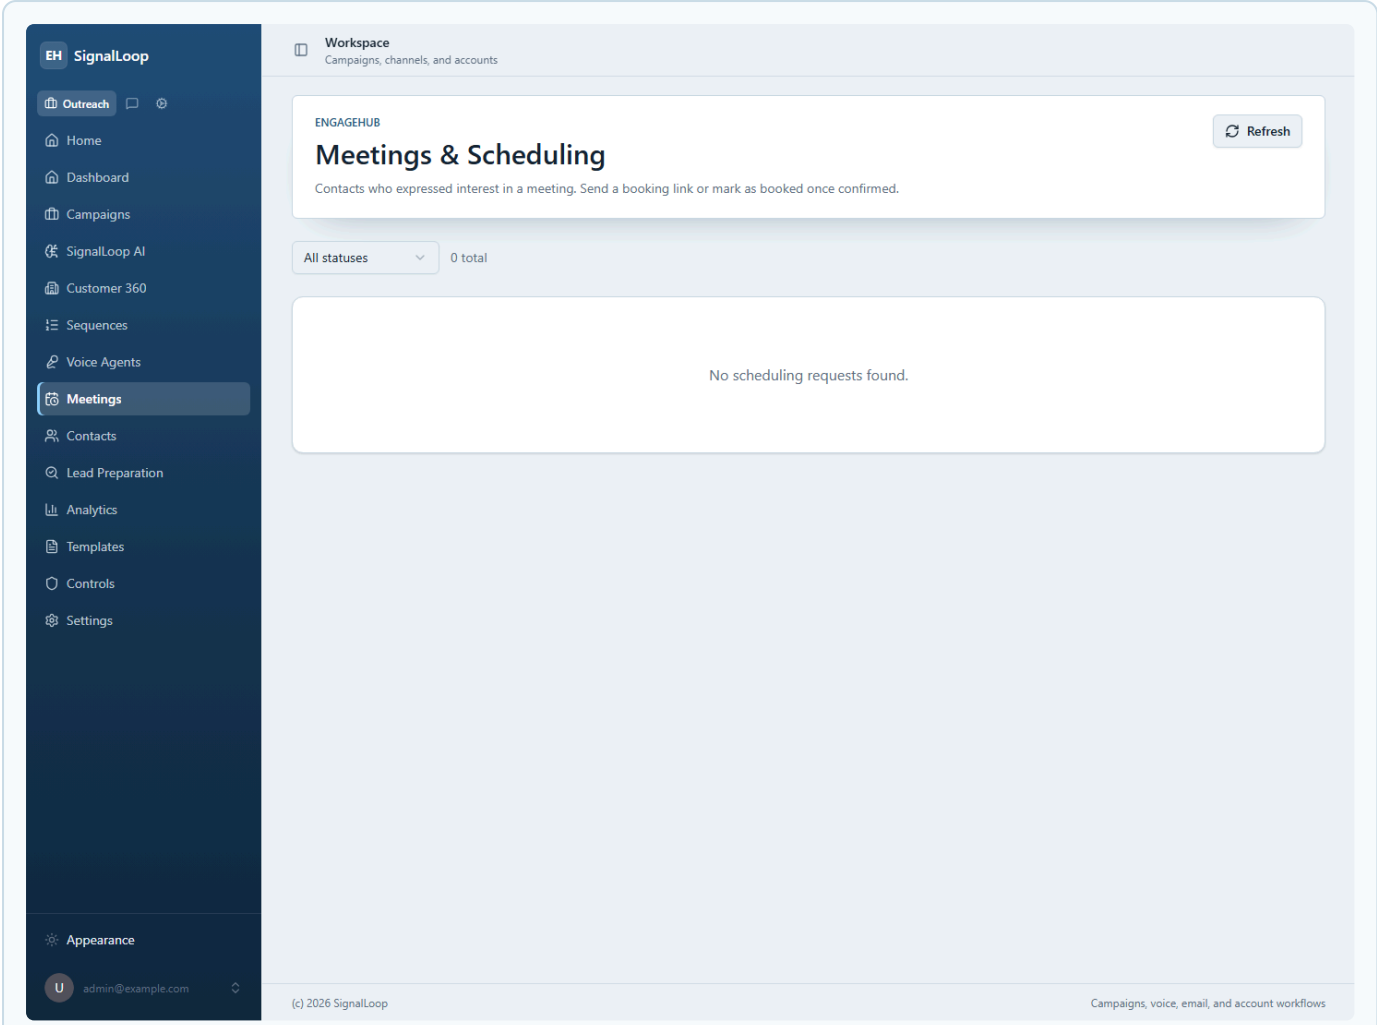

Voice Agents lets you choose a voice profile and language, maintain campaign scripts, inspect provider and callback readiness, and queue a manual test call when the required contact and script are selected. Browser preview validates the selected voice and script experience; it is not proof that a provider completed a live outbound call.

Voice Agents

Meetings

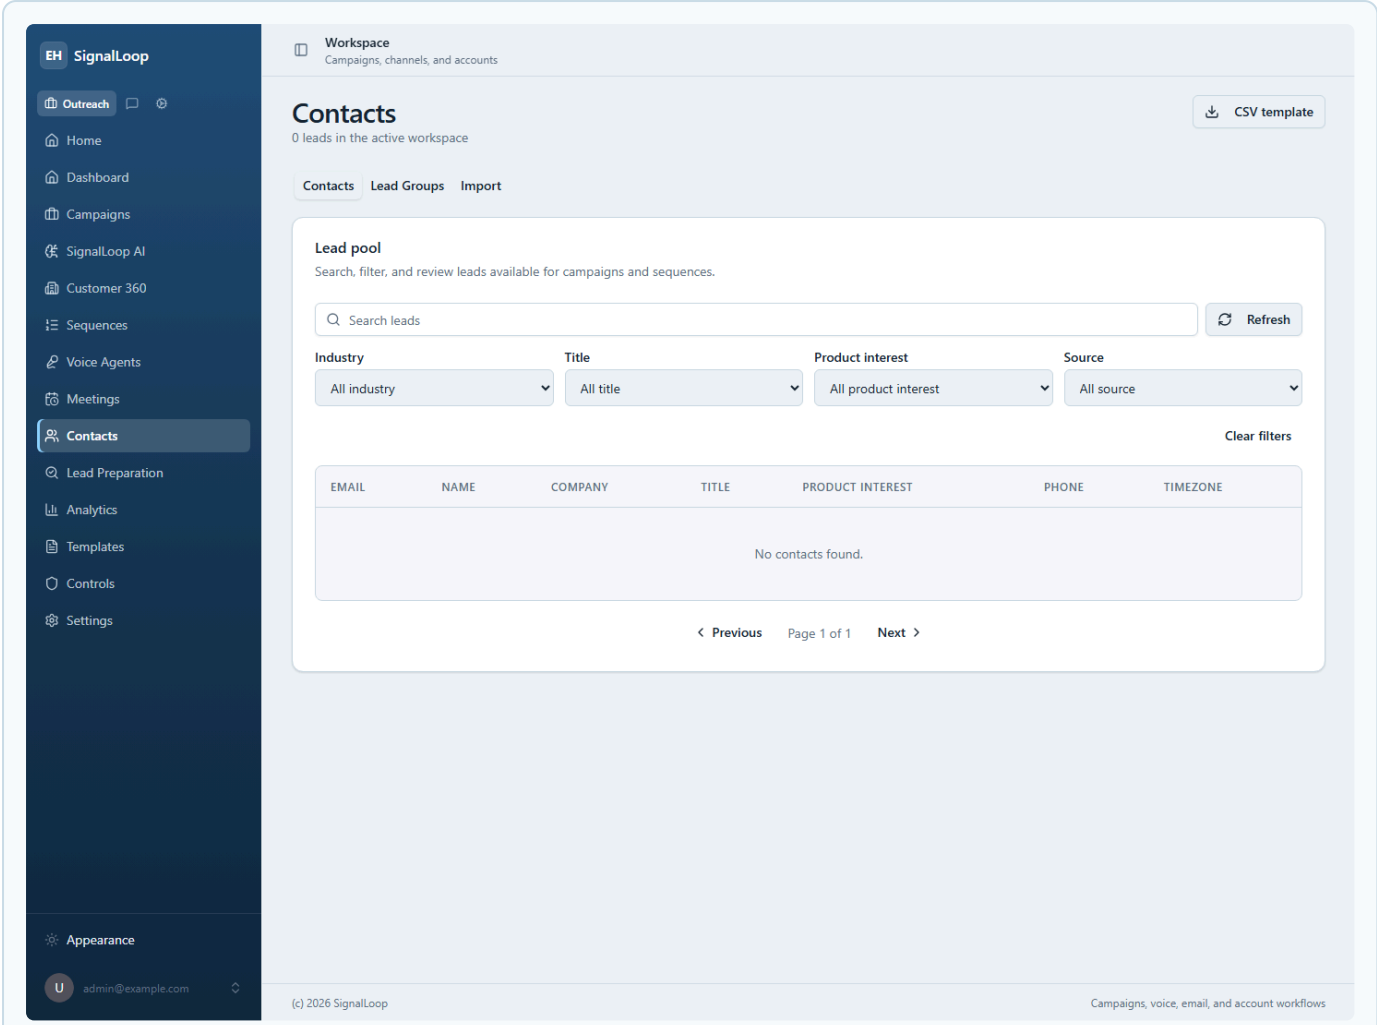

Meetings lists contacts that expressed booking interest and manages the scheduling lifecycle. Under the hood, the autonomous **Calendar Scheduler Agent** calculates open meeting windows, generates verified booking links, reconciles timezones, and writes immutable booking receipts with durable recovery across worker restarts.

Meetings

Contacts

Contacts is the active-workspace lead pool. Download the CSV template when importing; filter and review contacts, timelines, and suppression status before using them in campaigns or sequences.

Contacts

Lead Discovery

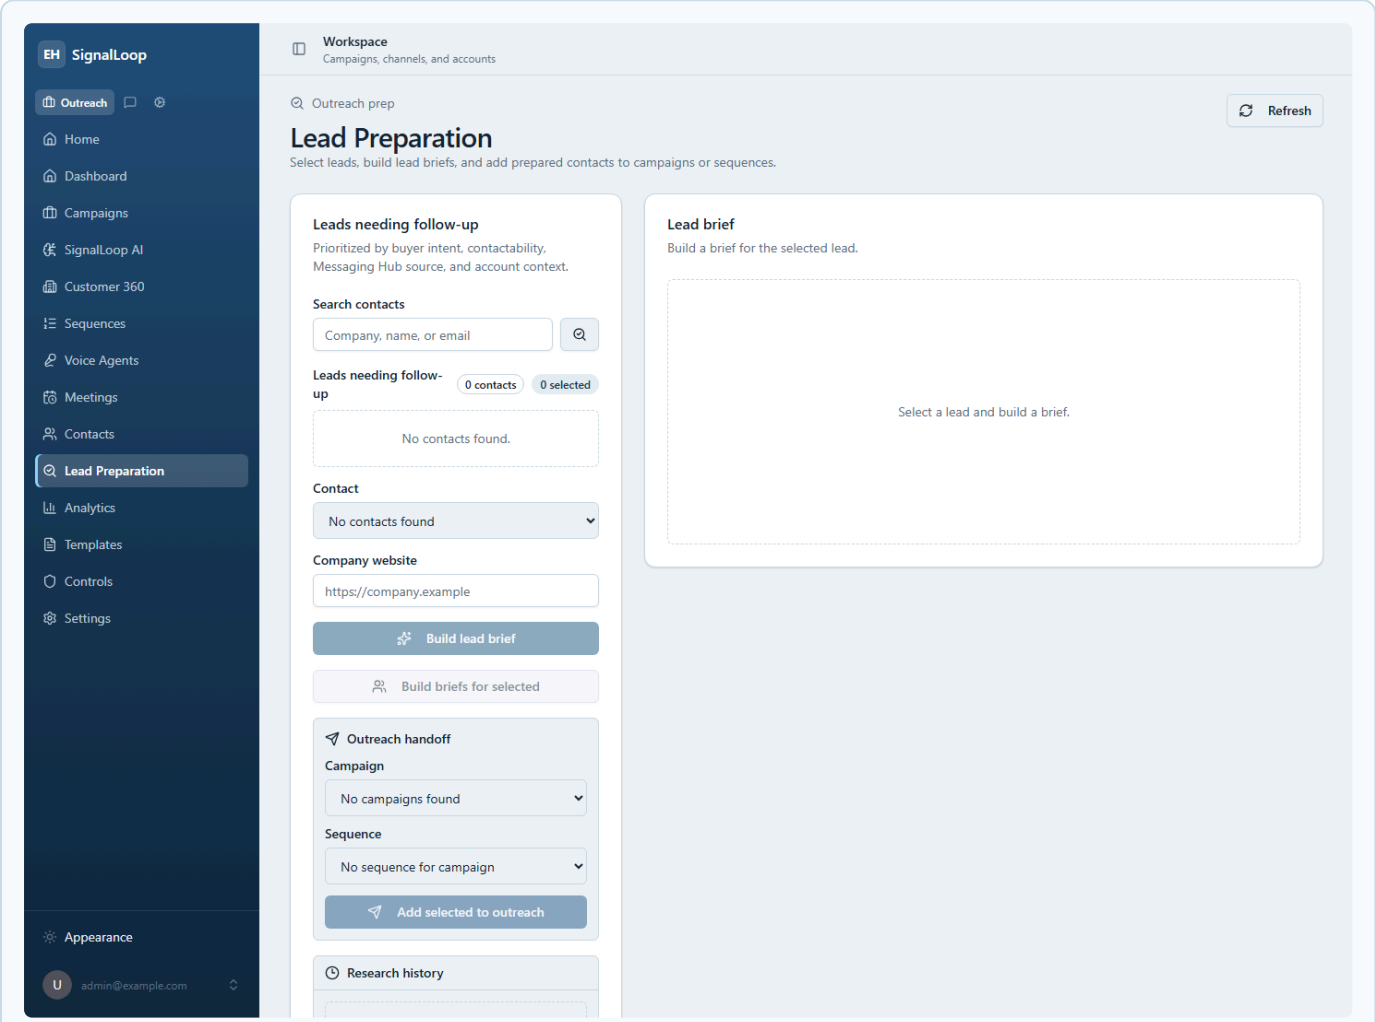

Lead Discovery provides an enterprise prospecting and AI enrichment console at `/lead-discovery`. It connects external market data sources with proprietary AI entity resolution and multi-dimensional qualification, enabling operators to find, enrich, score, and promote target accounts directly into active outreach.

- **ICP Filter Matrix:** Target prospects by industry vertical (Technology & SaaS, Fintech, Healthcare, Logistics, etc.), job titles (e.g., VP of Sales, Head of Growth), company size (employee count brackets), revenue ranges, geography, and target technology stack signals (e.g., Salesforce, AWS, HubSpot).
- **Pluggable Waterfall Gateway:** Queries external enrichment providers sequentially (Apollo.io, Clay.com, Burkettopti / leadspti, with an enterprise deterministic Sandbox fallback). If a provider lacks verified data or hits quota, the waterfall automatically cascades to the next adapter, maximizing direct-dial and email fill rates without vendor lock-in.
- **AI Entity Resolution & CRM Deduplication:** Automatically normalizes company names, strips corporate suffixes, canonicalizes root domains (`https://www.corp.acme.co.uk/about` -> `acme.co.uk`), and performs fuzzy matching against existing CRM accounts to classify match confidence (`EXACT_DOMAIN_MATCH` , `FUZZY_NAME_MATCH` , `NEW_ENTITY`).
- **4-Pillar AI Scoring & Opportunity Briefs:** Evaluates prospects across four objective pillars (100-point scale): Firmographic Fit (35 pts), Intent/Trigger Signals (30 pts), Role Authority (20 pts), and Data Completeness (15 pts). Assigns actionable fit bands (`HOT_OPPORTUNITY` , `HIGH_FIT` , `NURTURE` , `UNQUALIFIED`) and synthesizes LLM opportunity briefs with pain point analysis and tailored conversation starters for cold email and voice dialers.

- **1-Click CRM Promotion:** Converts discovered leads into tenant-scoped CRM contacts with strict workspace isolation and immediately enrolls them into active sequences or campaigns with append-only audit logging.
- **External Webhook Ingestion:** Ingests streaming lead signals from external sources and landing pages via `/api/v1/lead-discovery/webhooks/{provider}` for autonomous background enrichment and scoring.

Lead Preparation

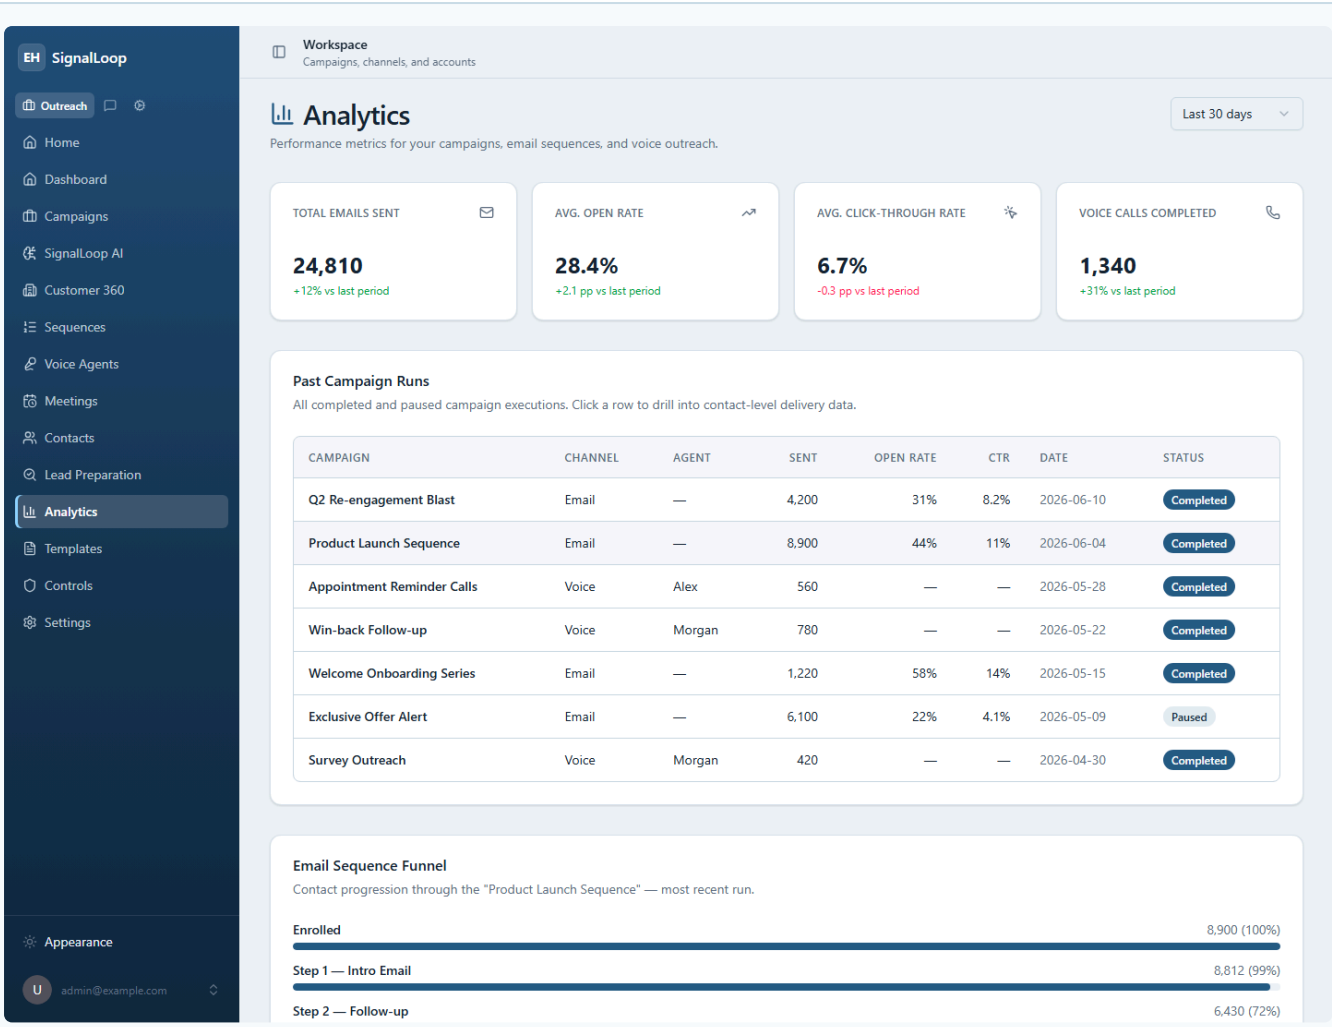

Lead Preparation is powered by the autonomous **Lead Preparation Agent**. It continuously evaluates contacts against versioned scoring policies, acquires atomic worker leases to prevent duplicate processing, compiles rich evidence packages, and feeds qualified leads into campaigns, sequences, or proposal generation.

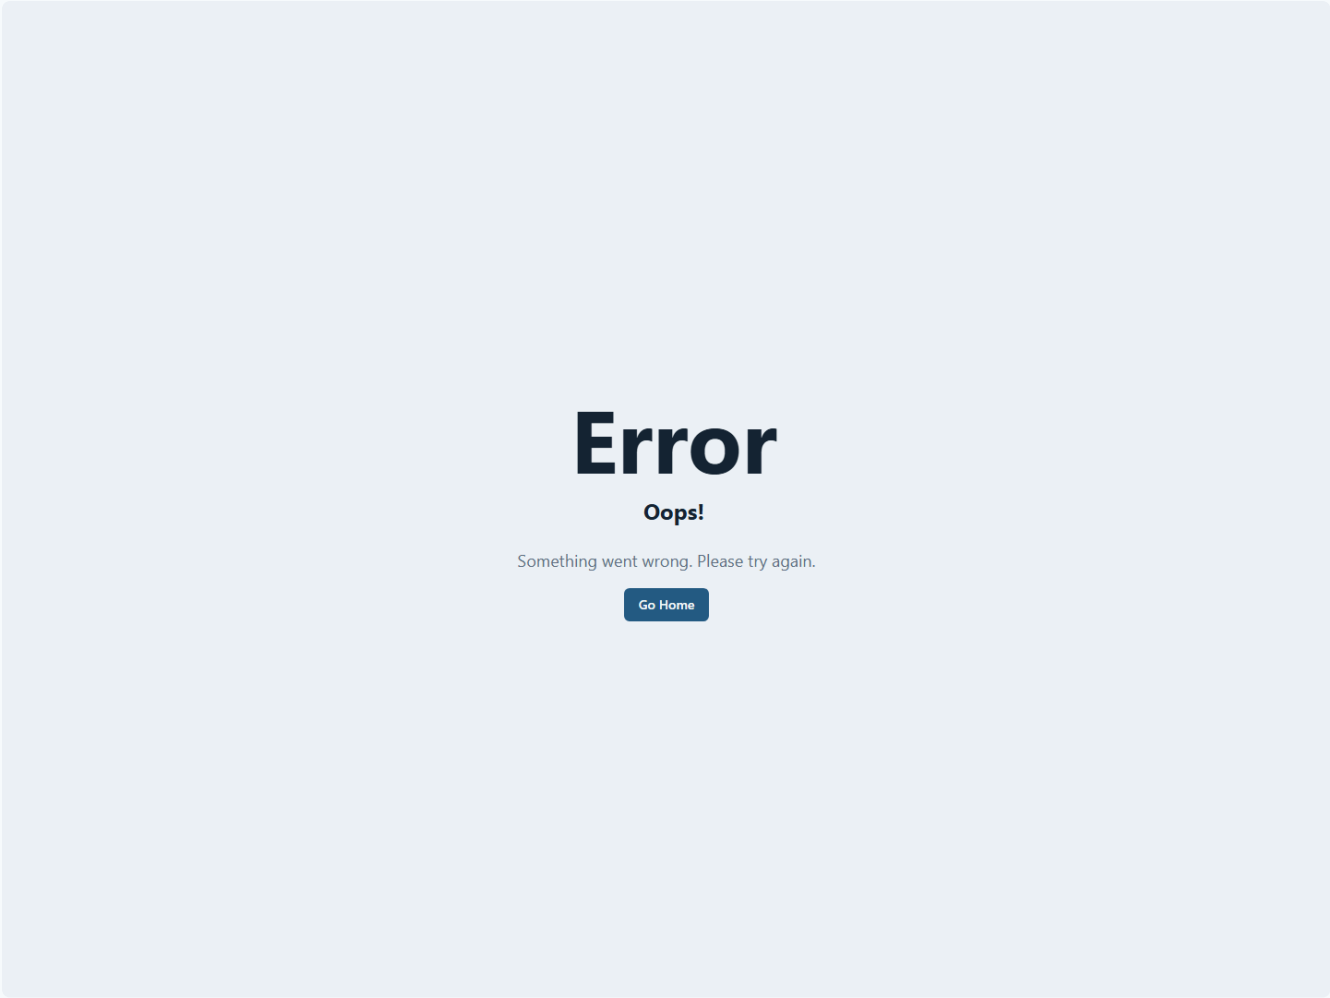

Lead Preparation

Analytics

Analytics presents campaign, email, and voice performance; use the correct workspace and time range for decisions. The current **Reporting** route renders an error screen in the verified build — treat it as unavailable until repaired.

Analytics

Reporting error state

Templates

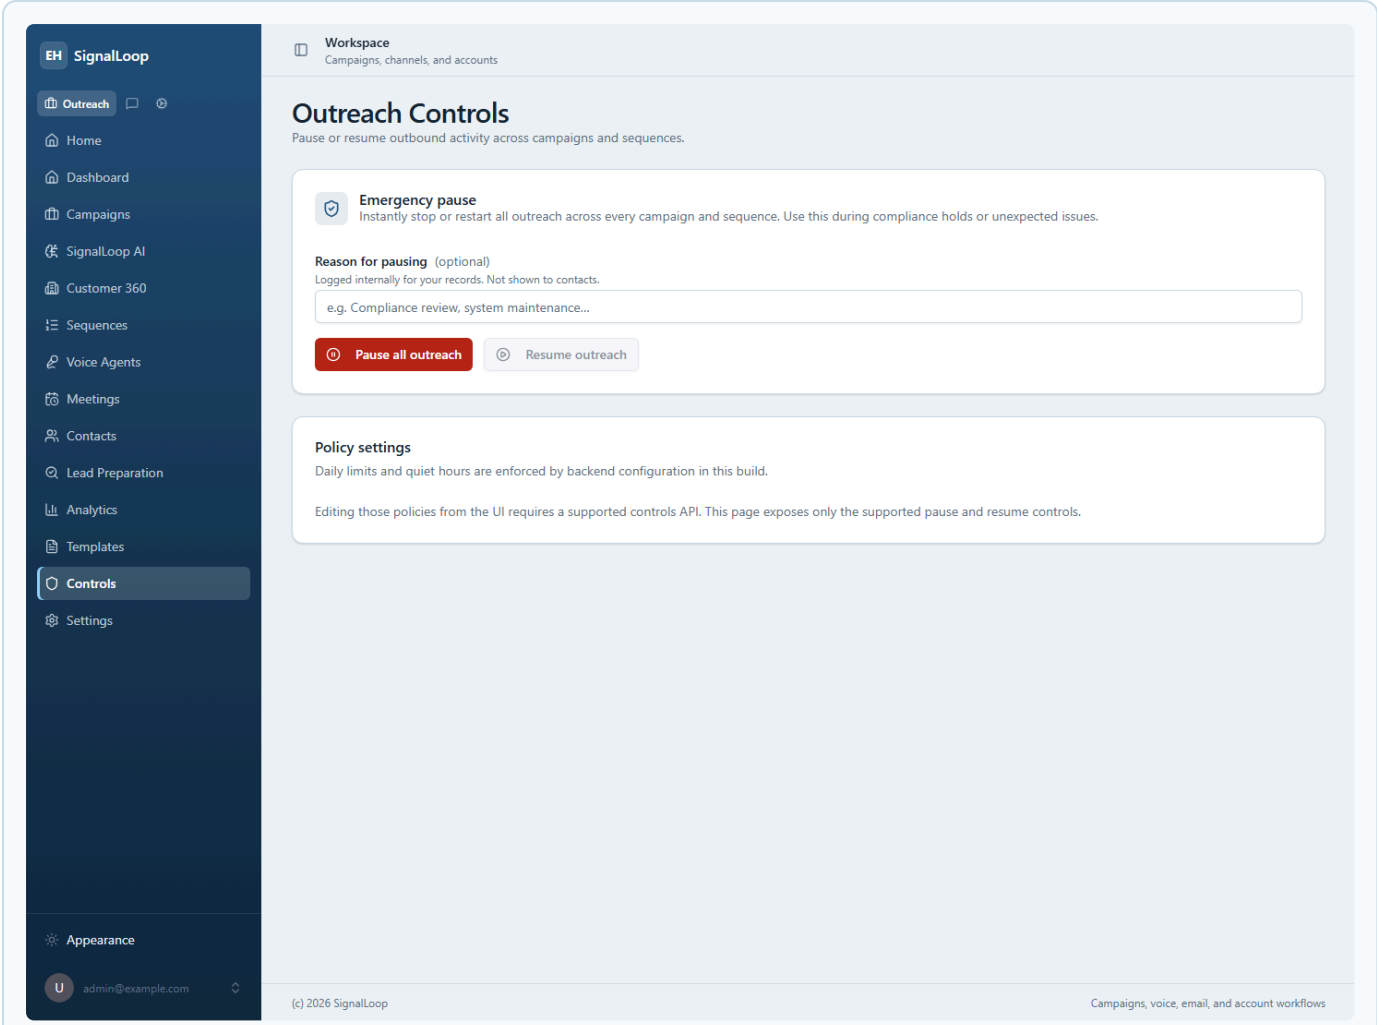

Templates provides starter templates and an editor. Preview tokens and publish only after unresolved tokens and policy issues are addressed.

Templates

Controls

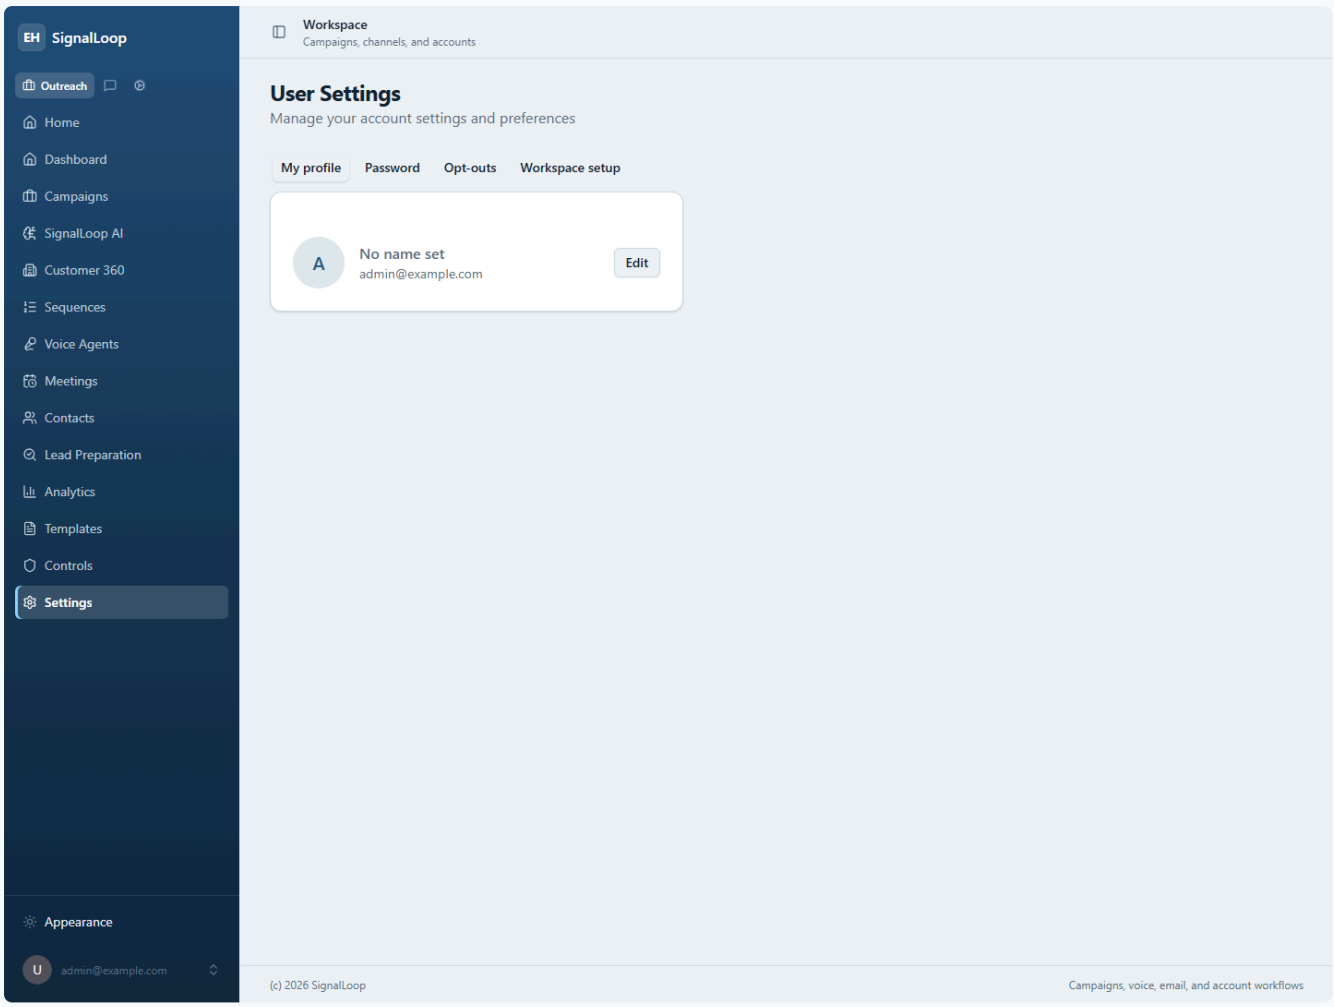

Controls is the safety surface. **Pause all outreach** stops outbound activity across campaigns and sequences; record a reason and verify the pause before communicating that sends stopped.

Controls

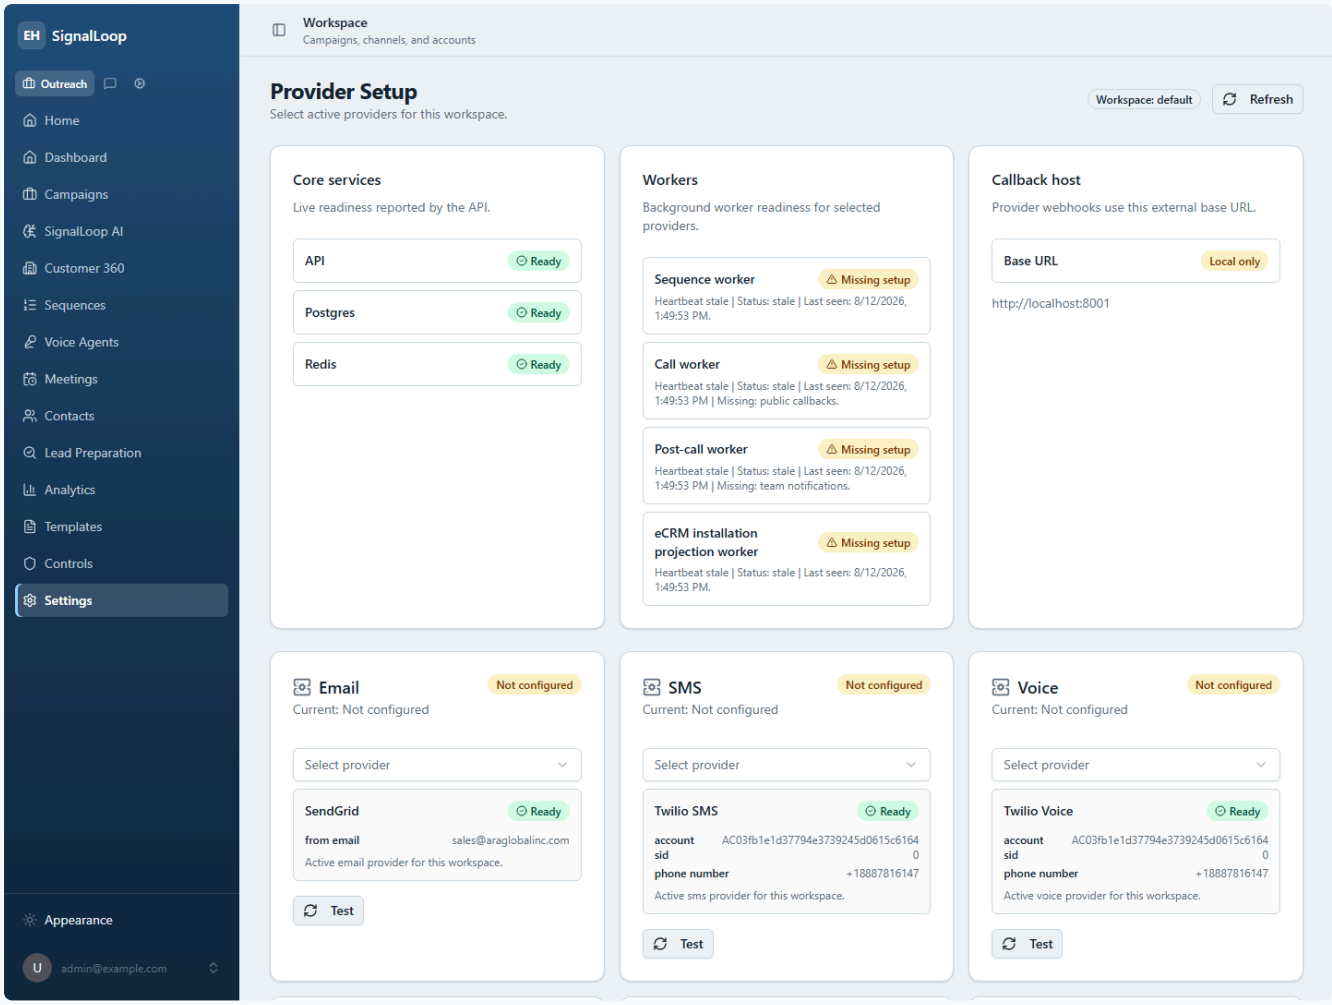

Settings

Settings contains profile and password controls. Role-dependent tabs include opt-outs, workspace setup, and provider setup.

User Settings

Provider Setup is superuser-only and reports API, PostgreSQL, Redis, and worker readiness. Keep provider keys private. Worker cards can be stale or missing in a local build; do not treat the web UI alone as proof that a delivery worker processed a campaign, use the relevant operational health and delivery/audit evidence instead.

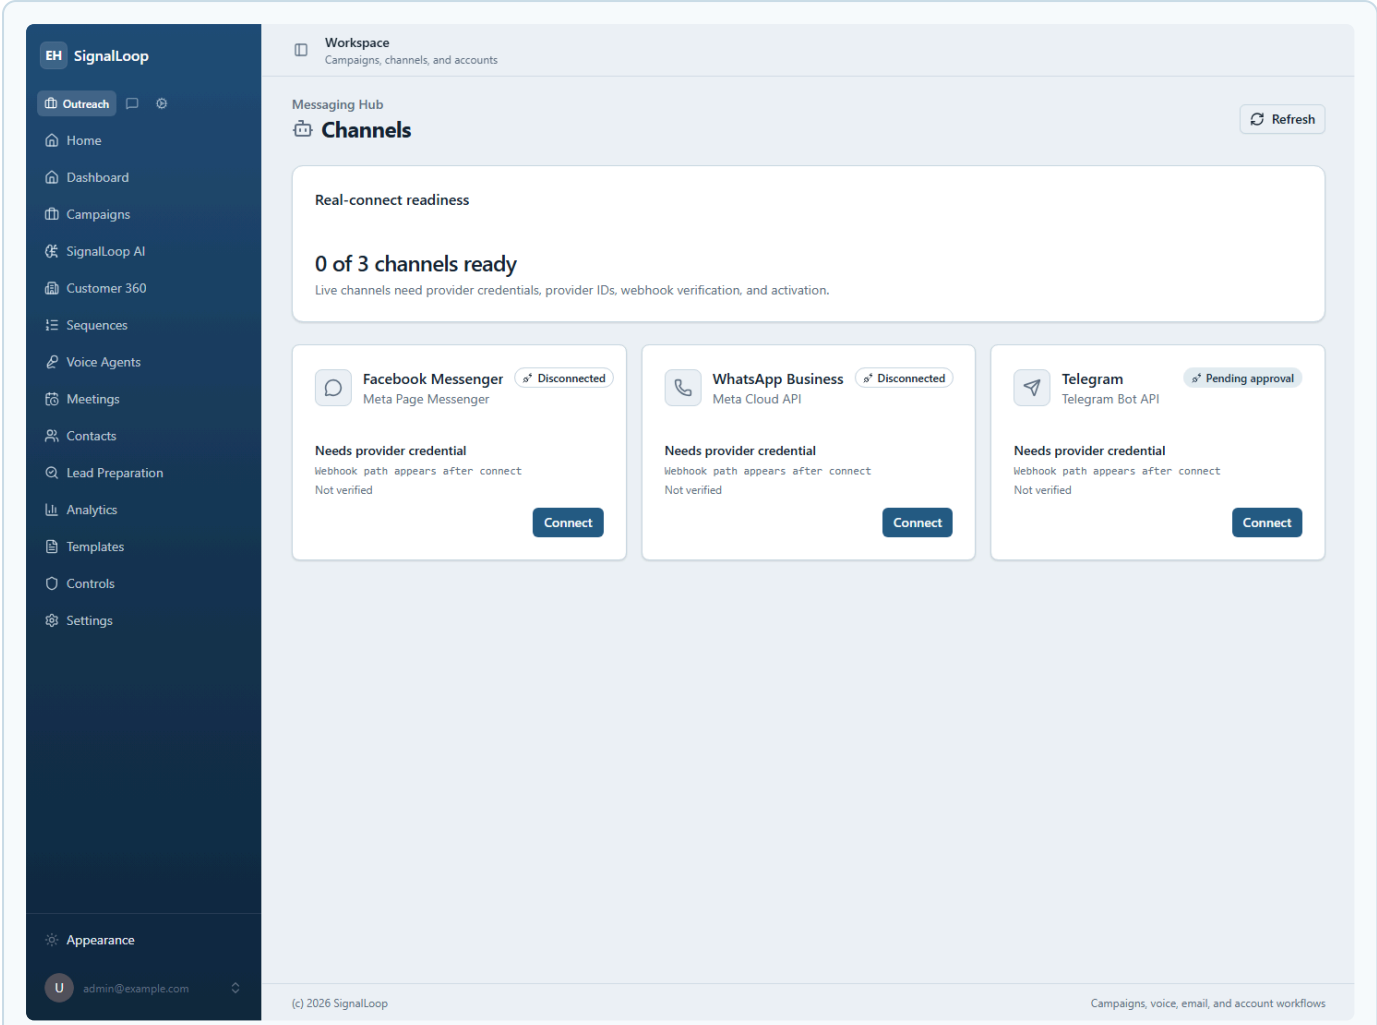

Provider Setup

Messaging

Switching to Messaging exposes Messaging Hub Channels, Knowledge Base, Inbox, Analytics, and Settings. Channel and knowledge-base administration requires the appropriate elevated role.

Channels

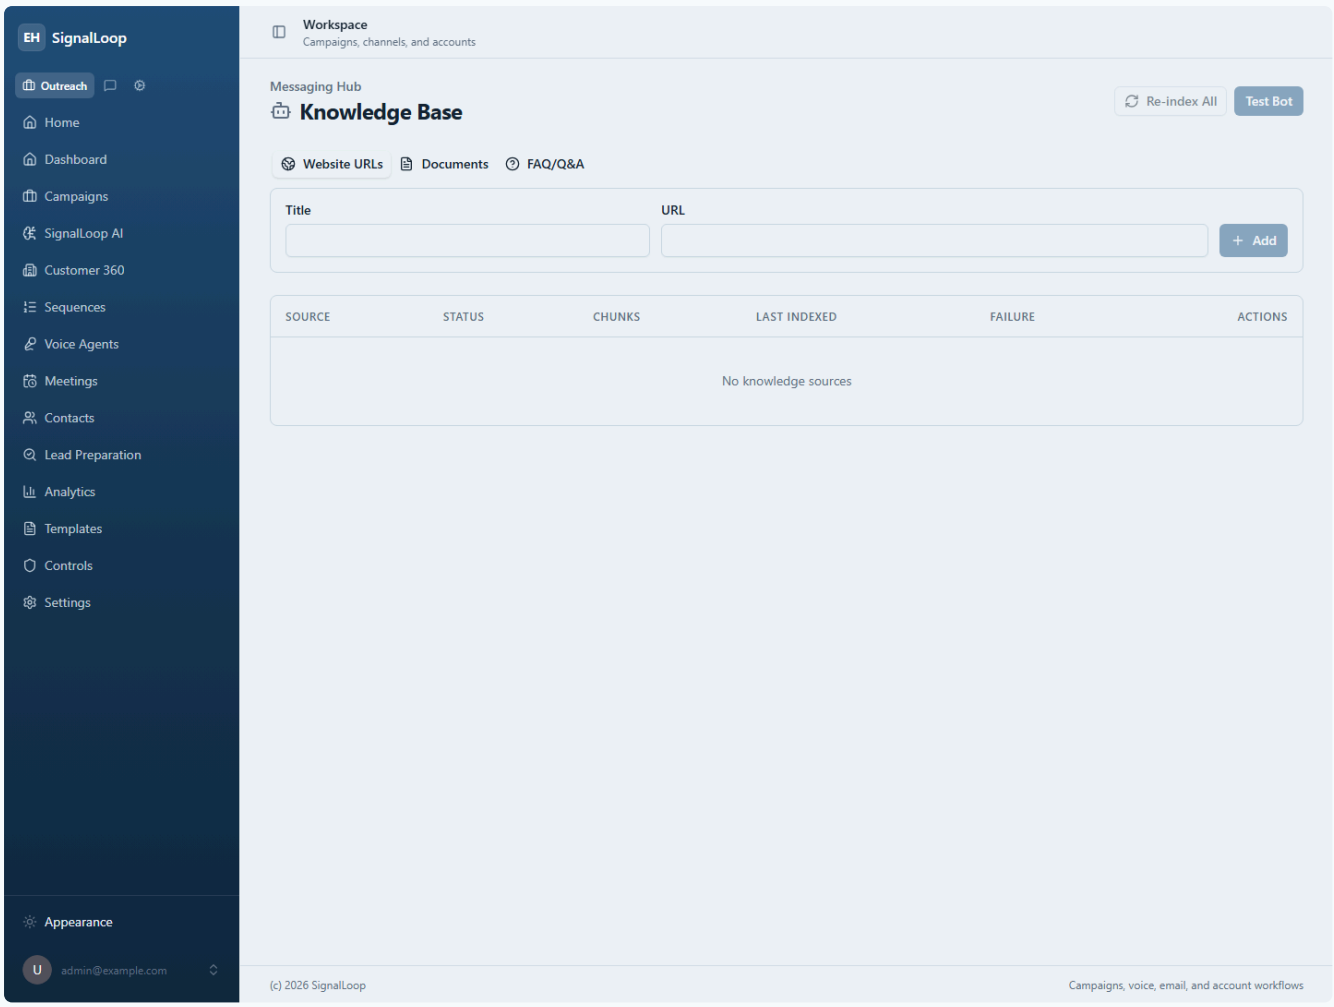

An authorized administrator connects a channel here. Live channels require provider credentials, provider IDs, webhook verification, and activation. No demo or empty-state card means that a provider is live — confirm credentials, webhook verification, and activation first.

Messaging Hub Channels

Knowledge Base

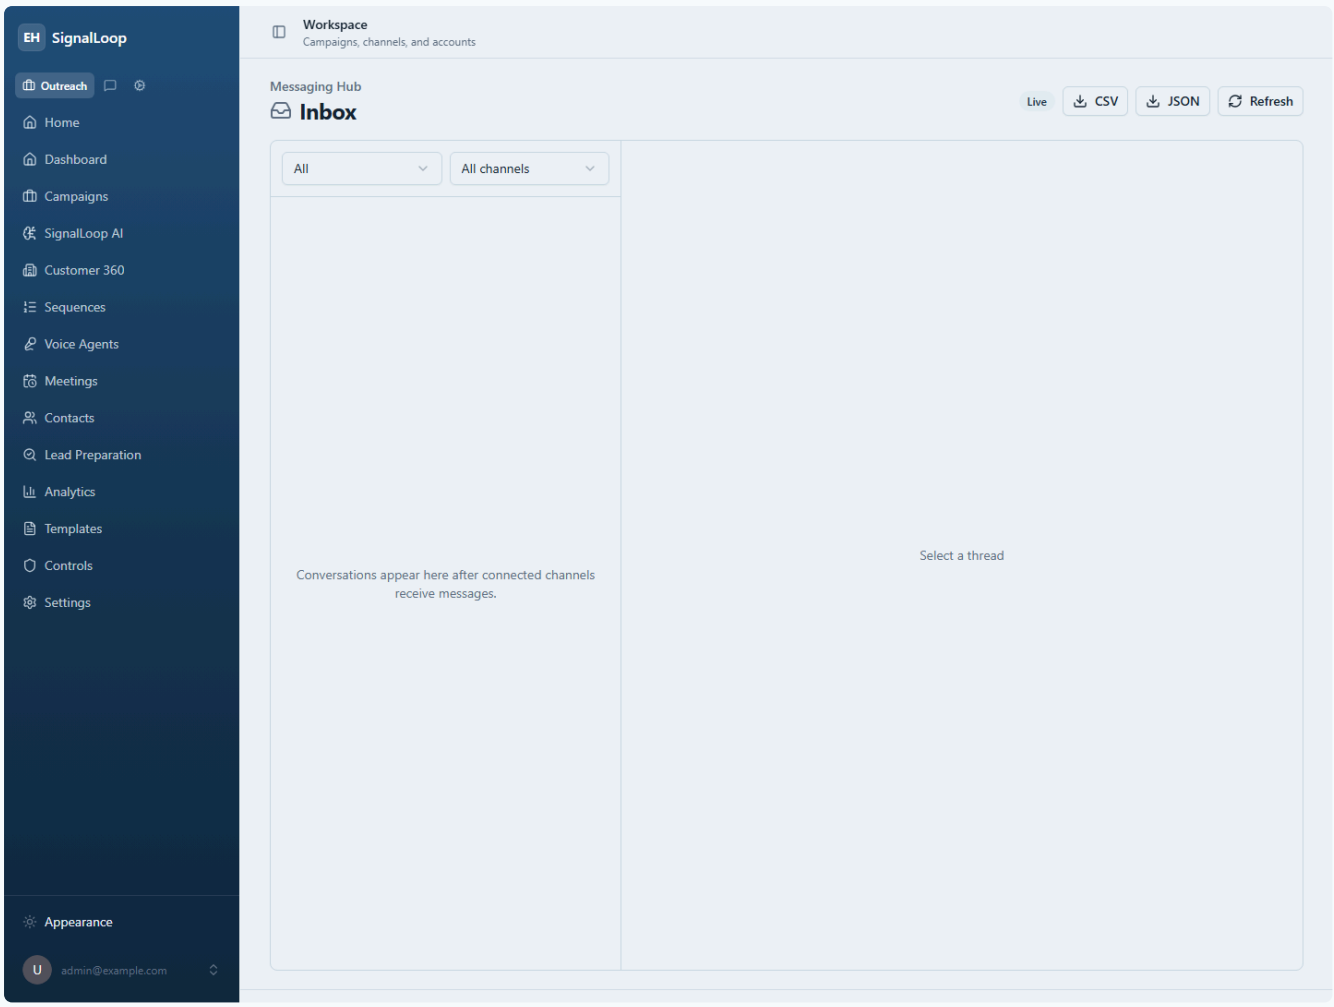

An administrator adds Website URLs, documents, or FAQ/Q&A entries here, then re-indexes and tests the bot as appropriate.

Messaging Hub Knowledge Base

Inbox

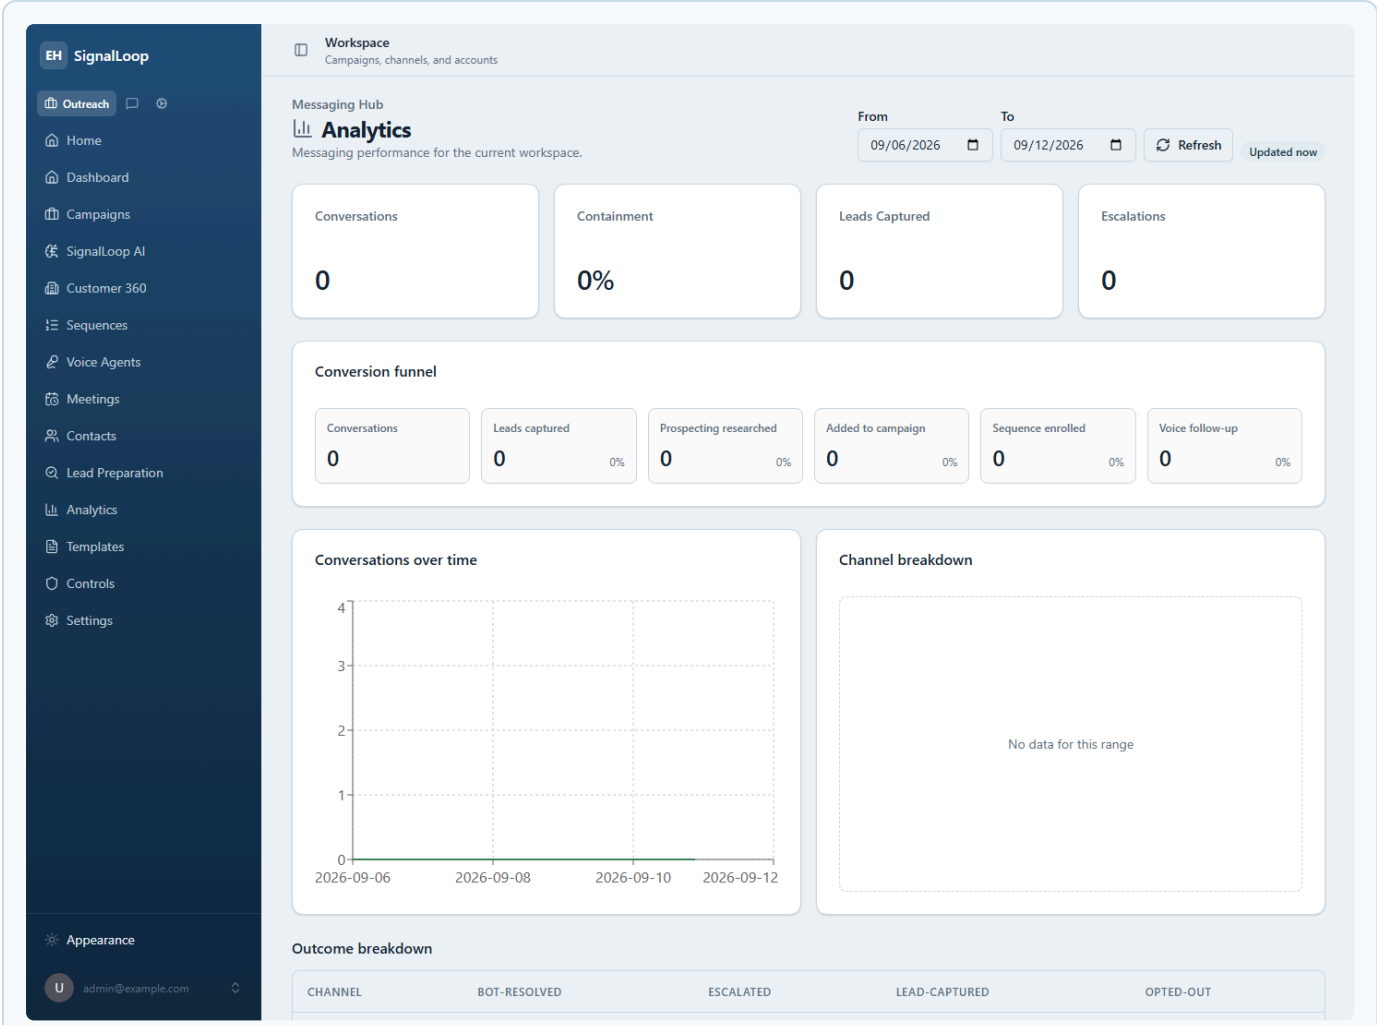

Operators work conversations here after connected channels receive messages. Use filters and select a thread for its detail.

Messaging Hub Inbox

Analytics

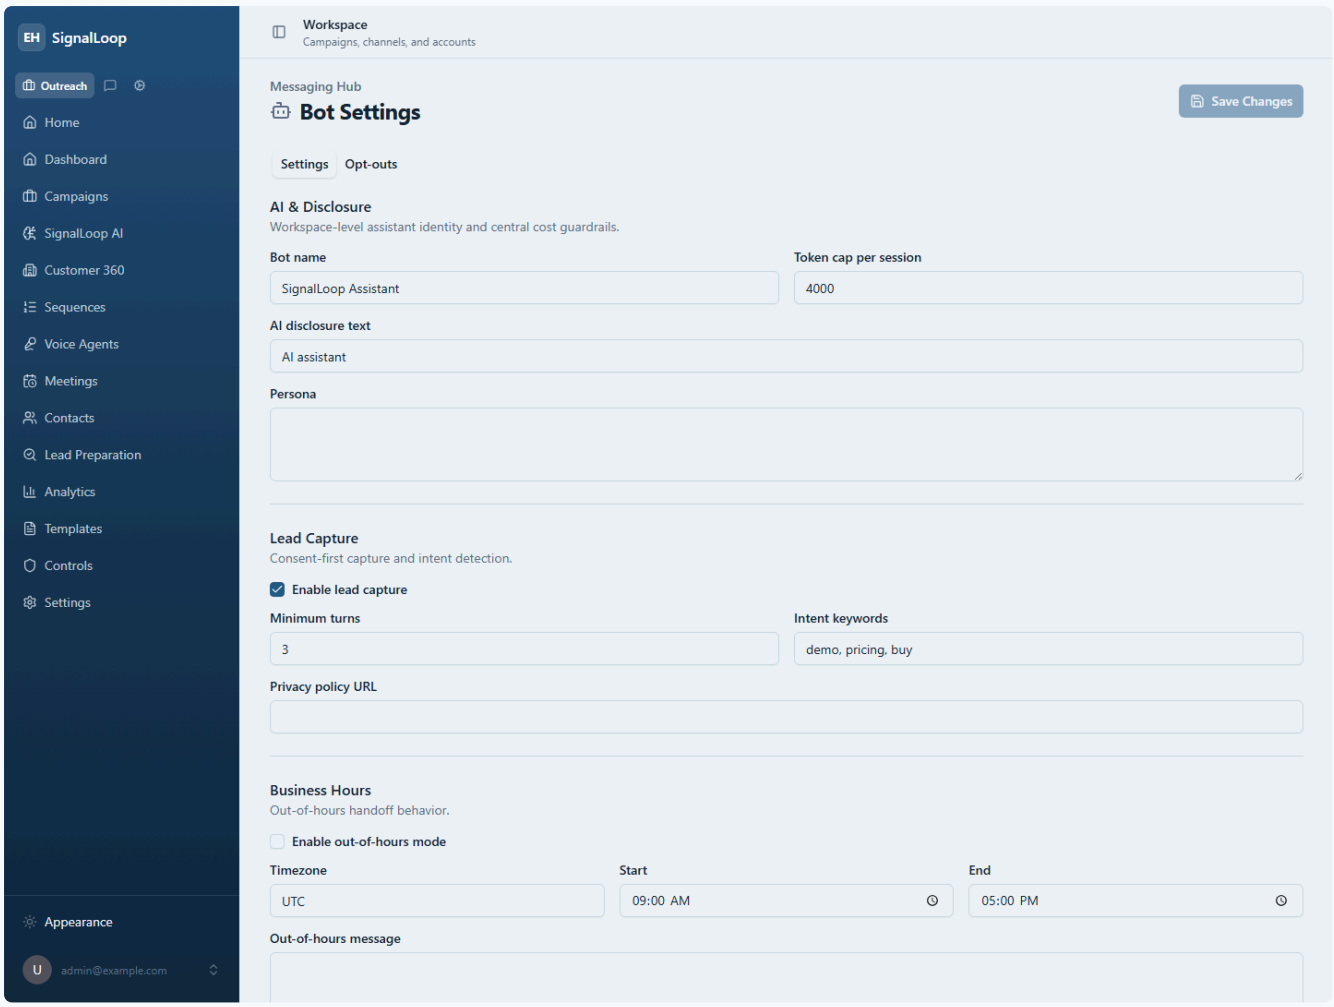

Review conversations, containment, captured leads, escalations, conversion funnel, and channel outcomes.

Messaging Hub Analytics

Settings

Authorized administrators maintain behavior here and review failed messages in **Admin > Dead Letters**.

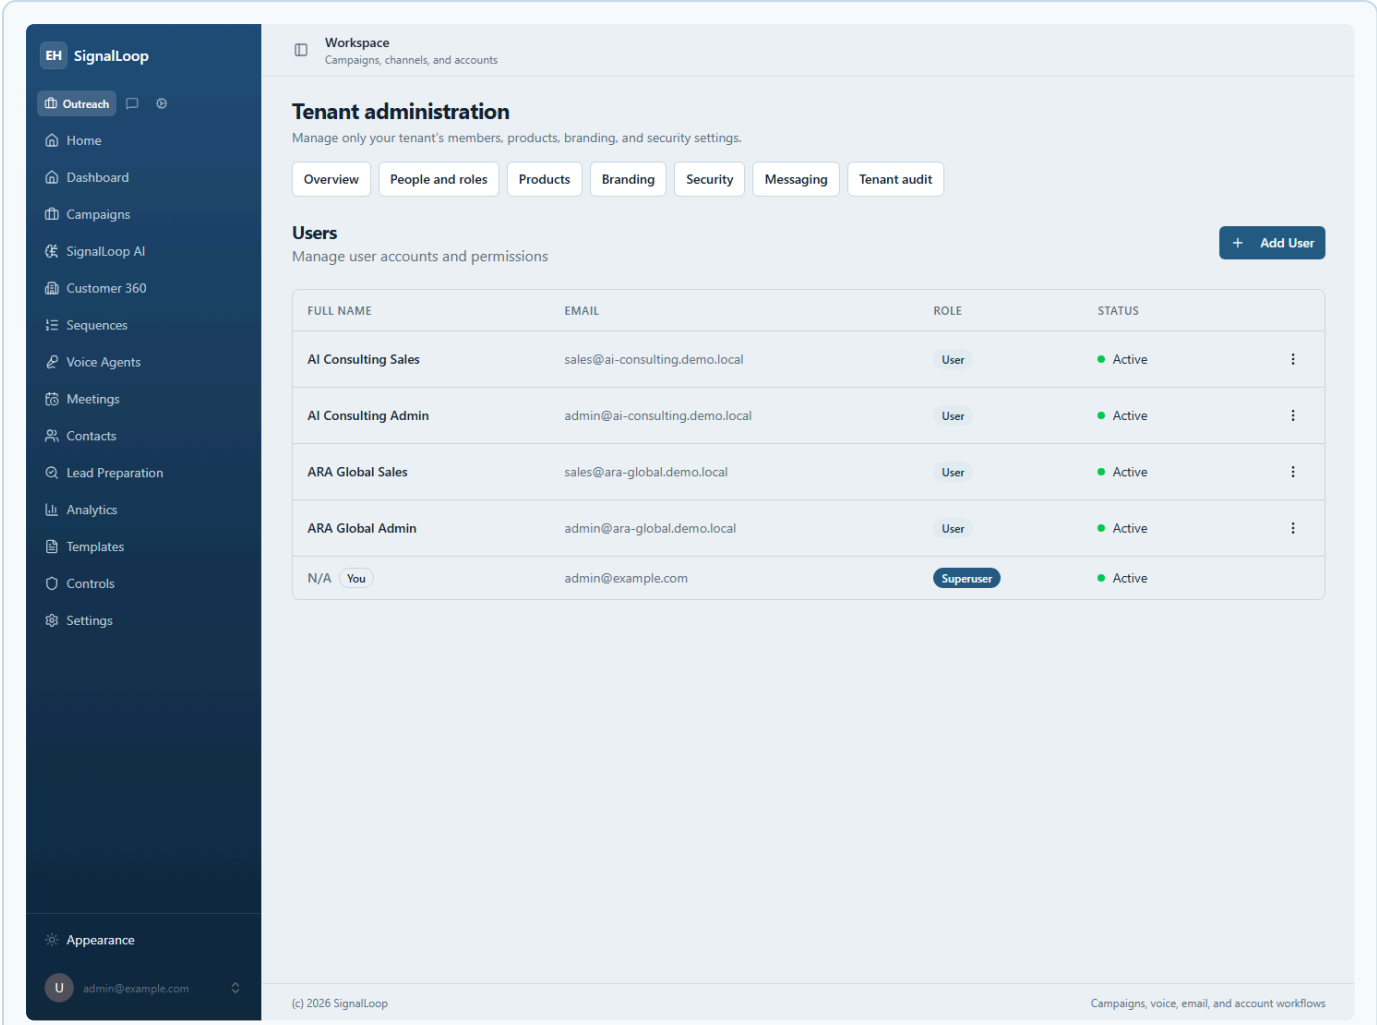

Messaging Hub Settings

Admin

Superusers use Admin for tenant people and roles, products, branding, security, messaging, audit, and dead letters. Standard users will not see this control. Admin is tenant-scoped; it is not a cross-tenant data browser.

Tenant administration

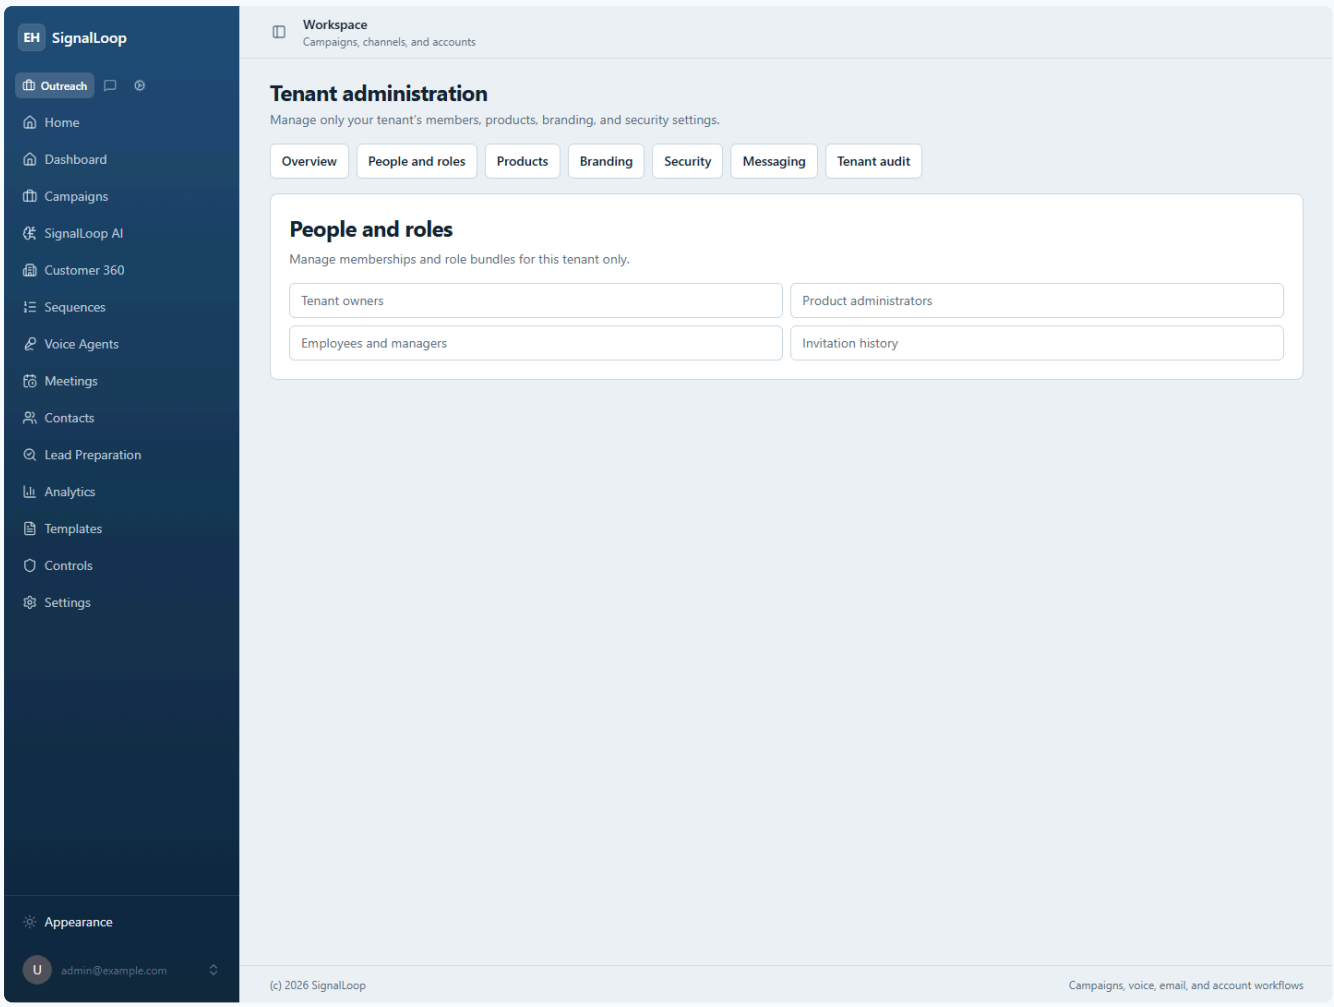

The landing screen for tenant people and roles, products, branding, security, messaging, and audit.

Tenant administration

People and roles

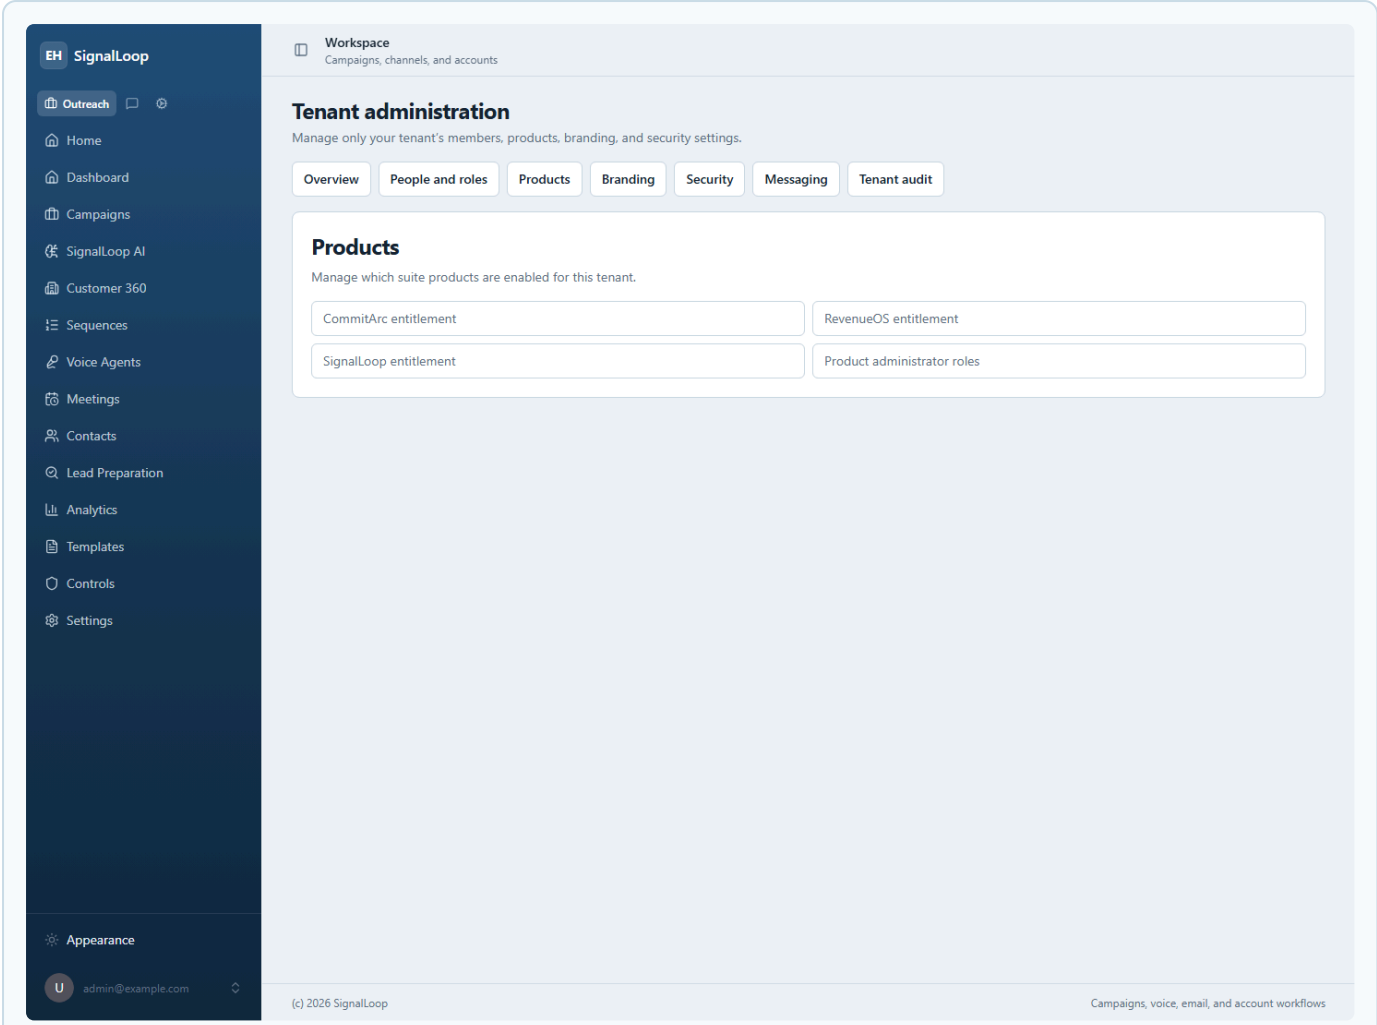

Manage tenant membership and role assignment.

People and roles

Tenant products

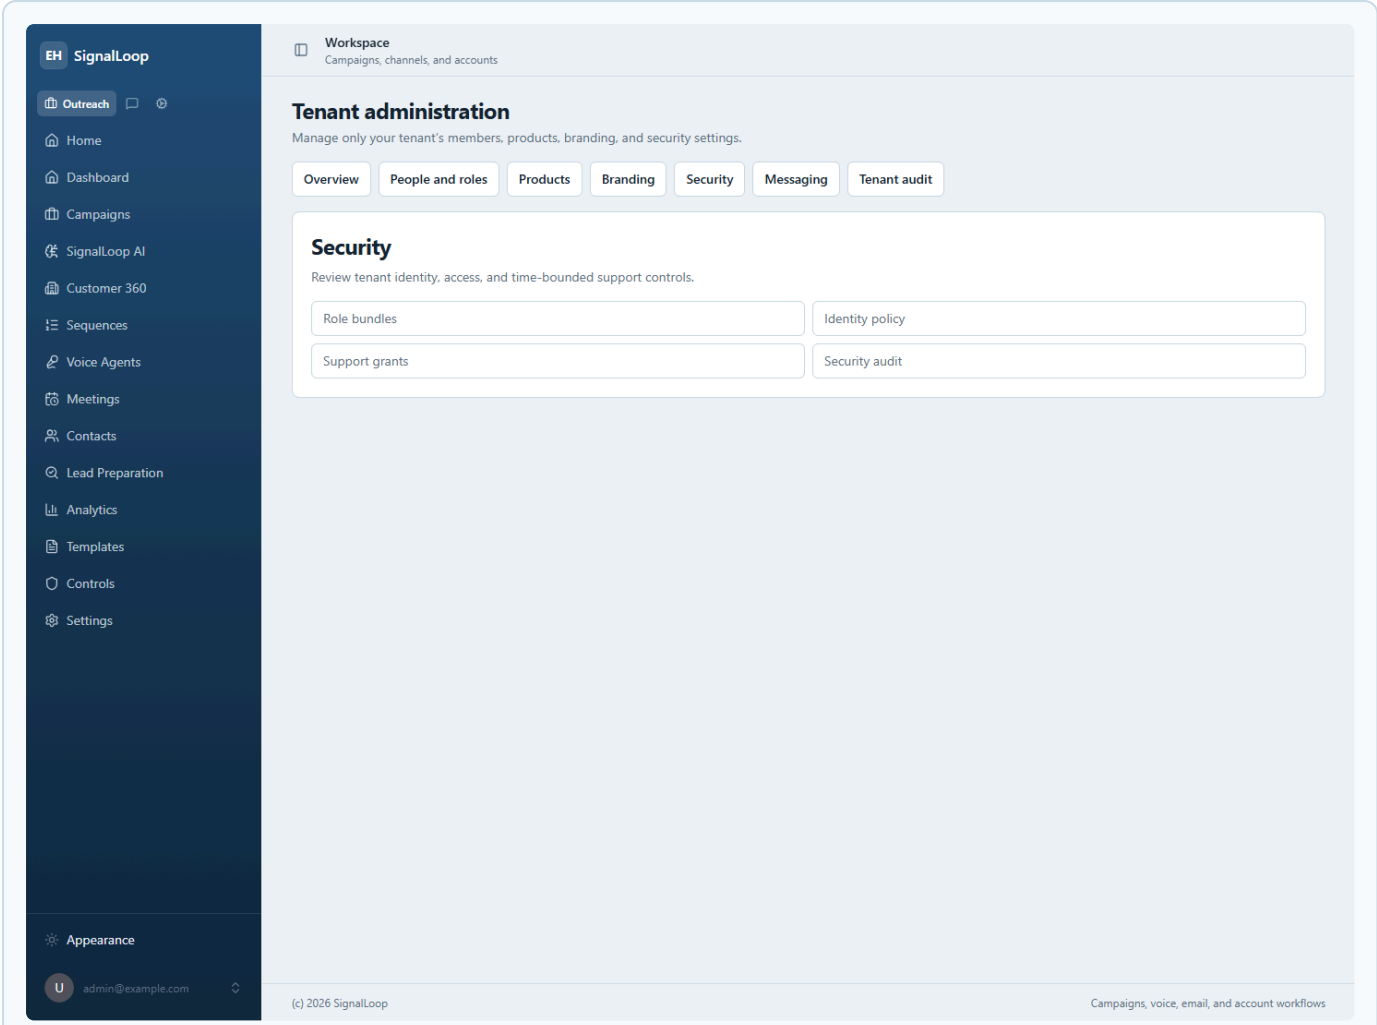

Manage which products — CommitArc, RevenueOS, SignalLoop — are entitled to the tenant.

Tenant products

Tenant security

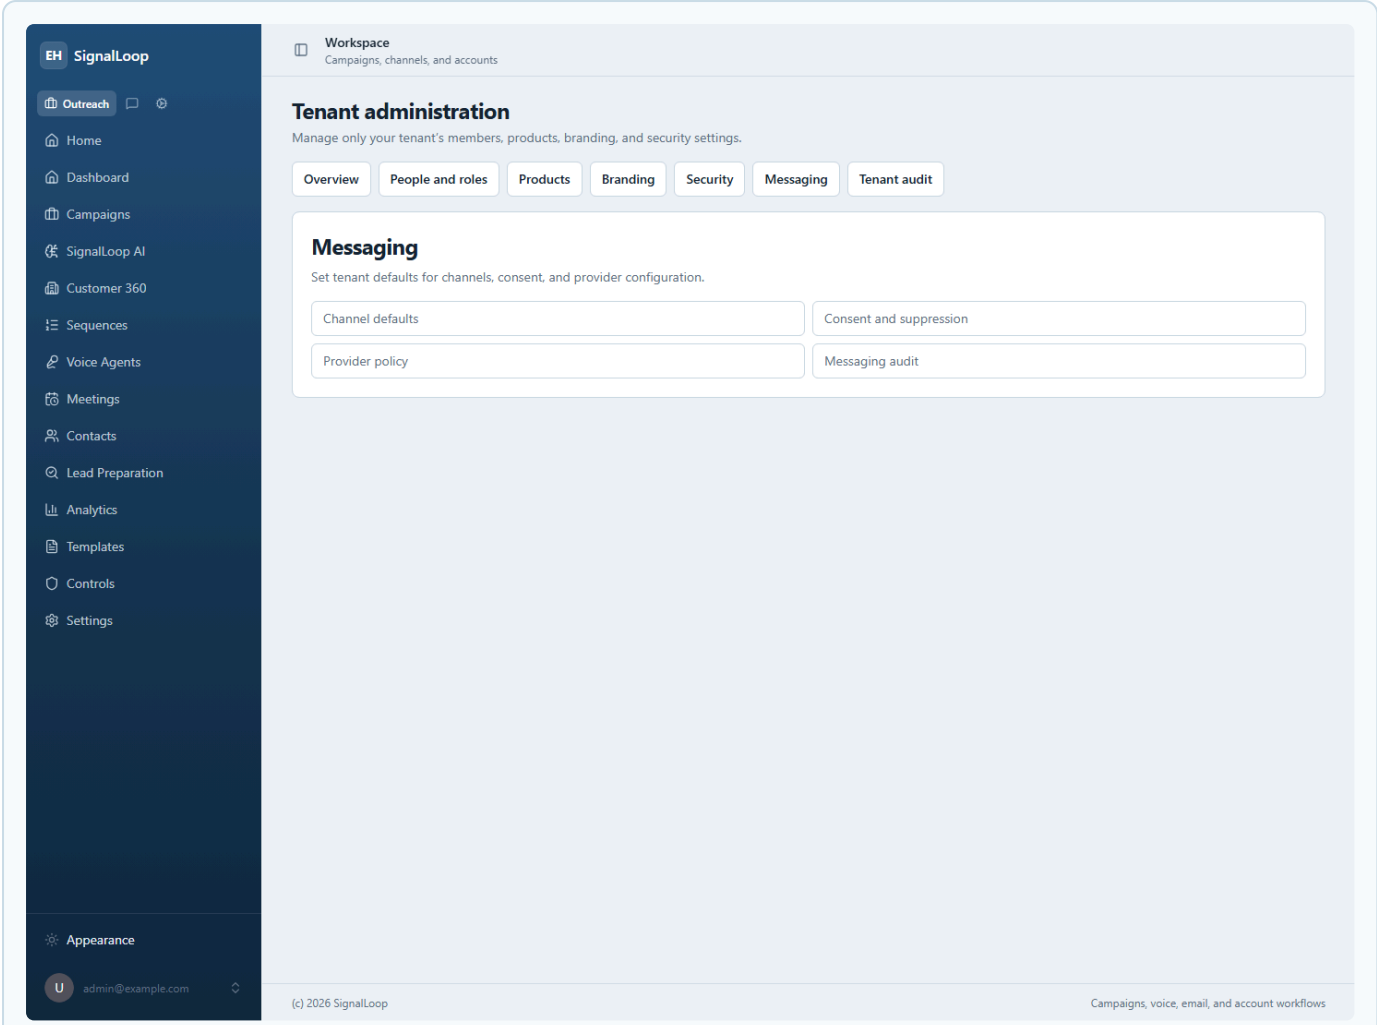

Manage tenant-level security controls.

Tenant security

Tenant messaging

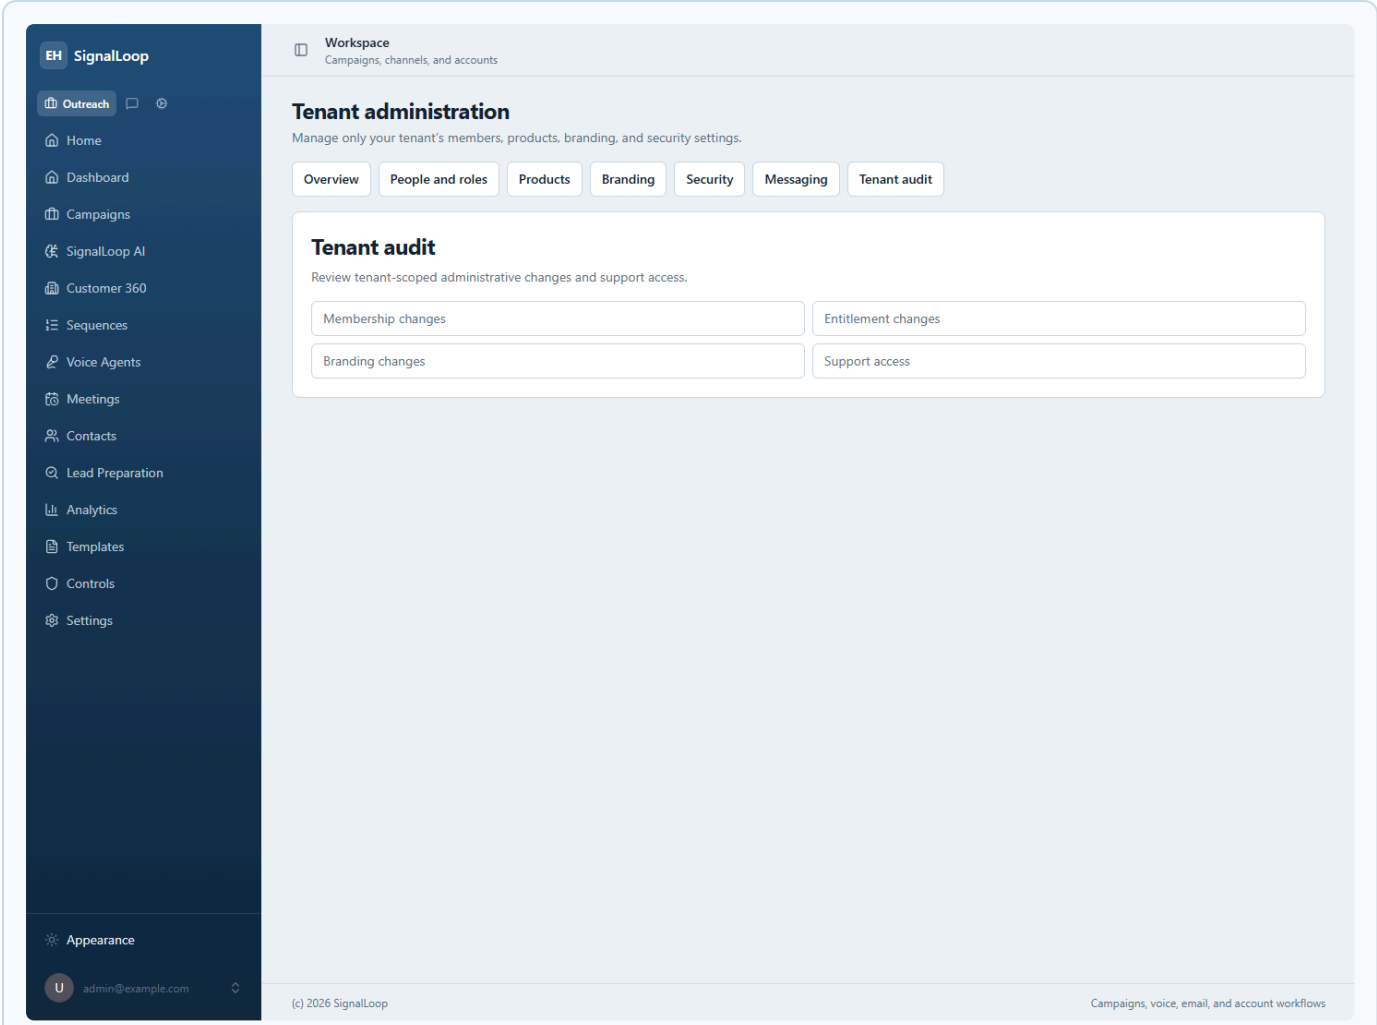

Manage tenant messaging configuration; this is separate from Messaging Hub's own Settings tab.

Tenant messaging

Tenant audit

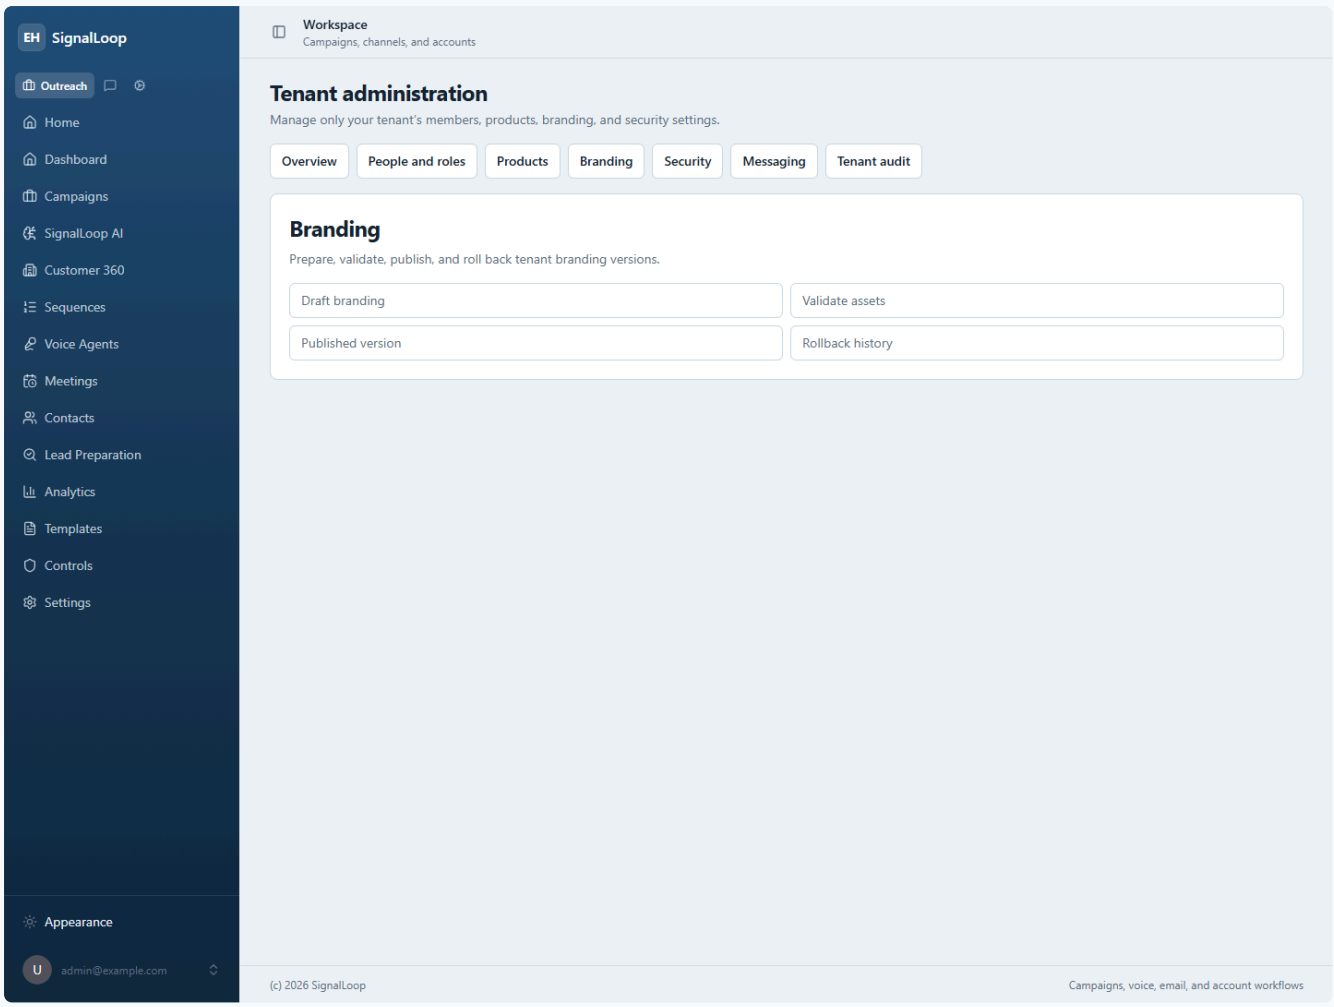

Review the tenant audit trail.

Tenant audit

Tenant branding

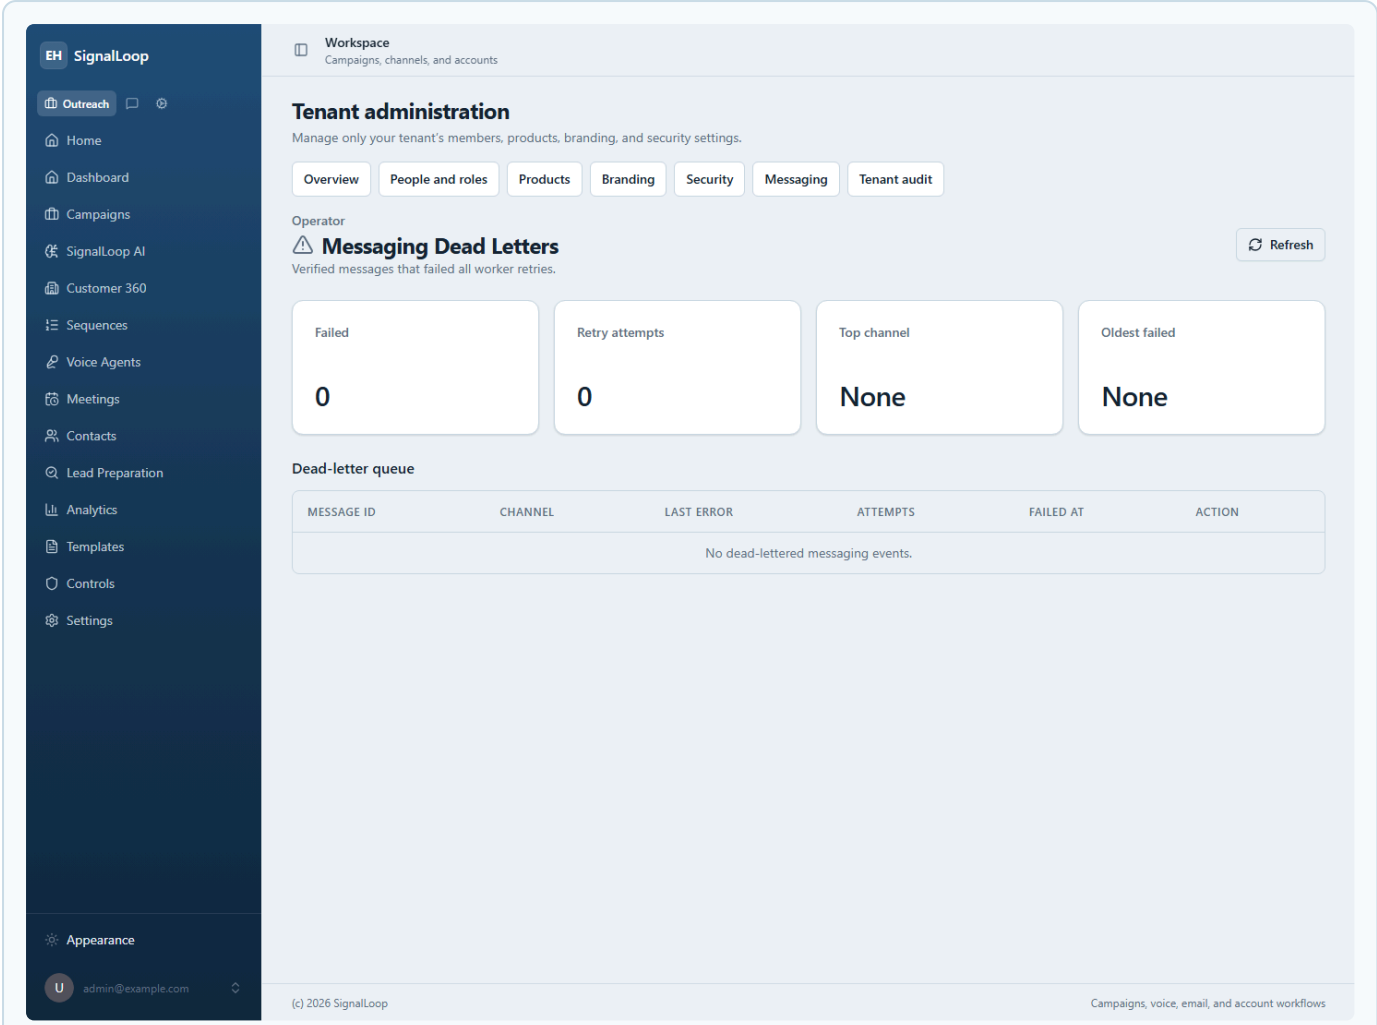

Manage tenant branding assets and versioning.

Tenant branding

Messaging dead letters

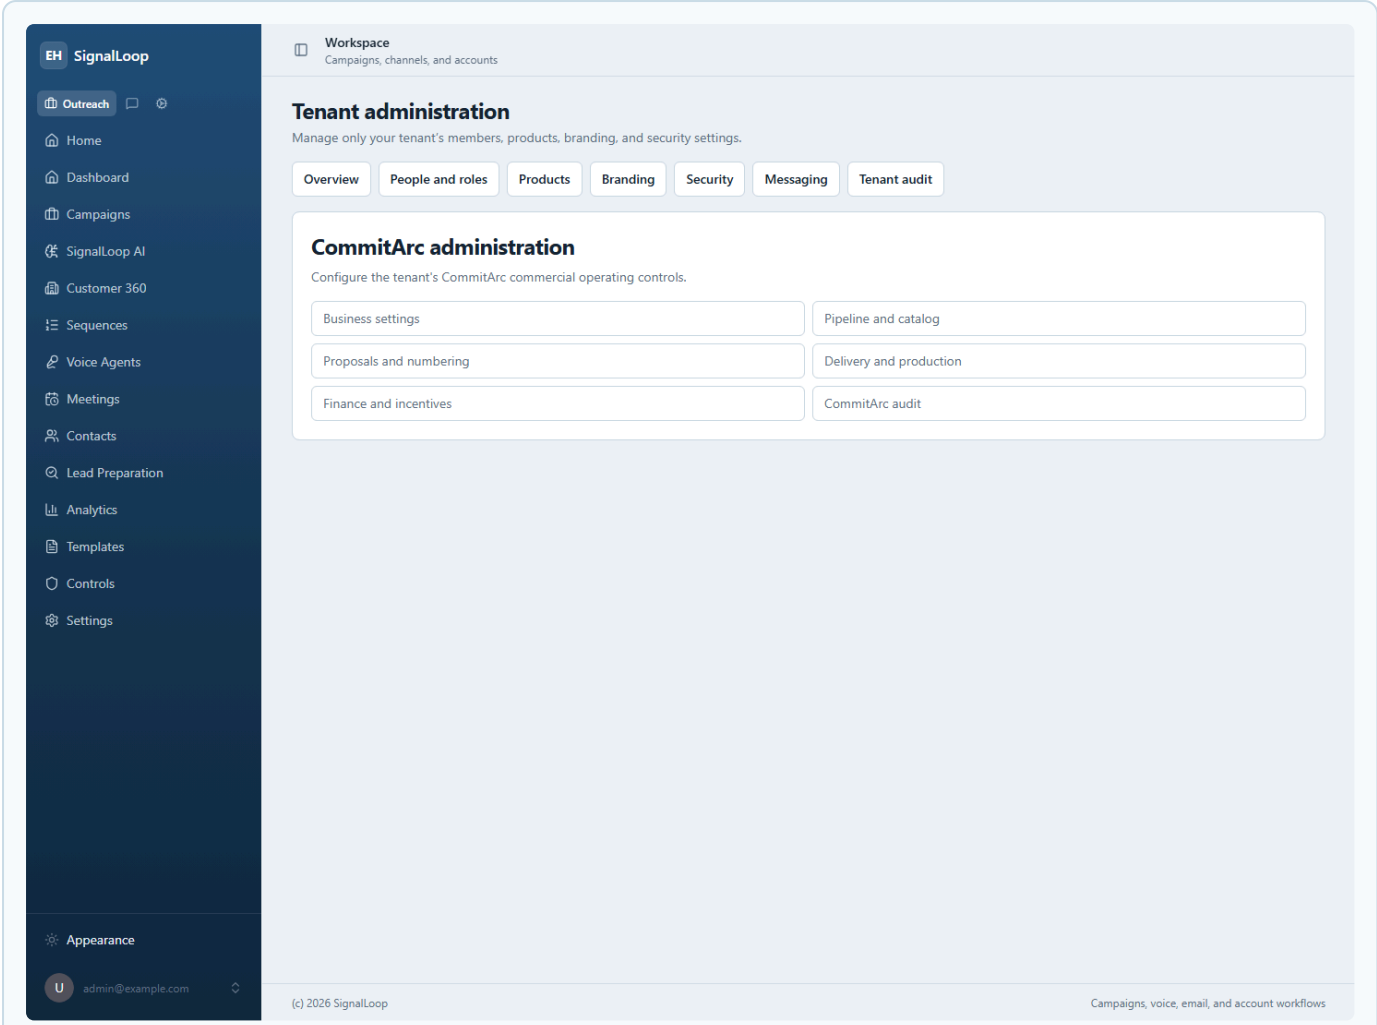

Review Messaging Hub messages that failed delivery.

Messaging dead letters

CommitArc administration

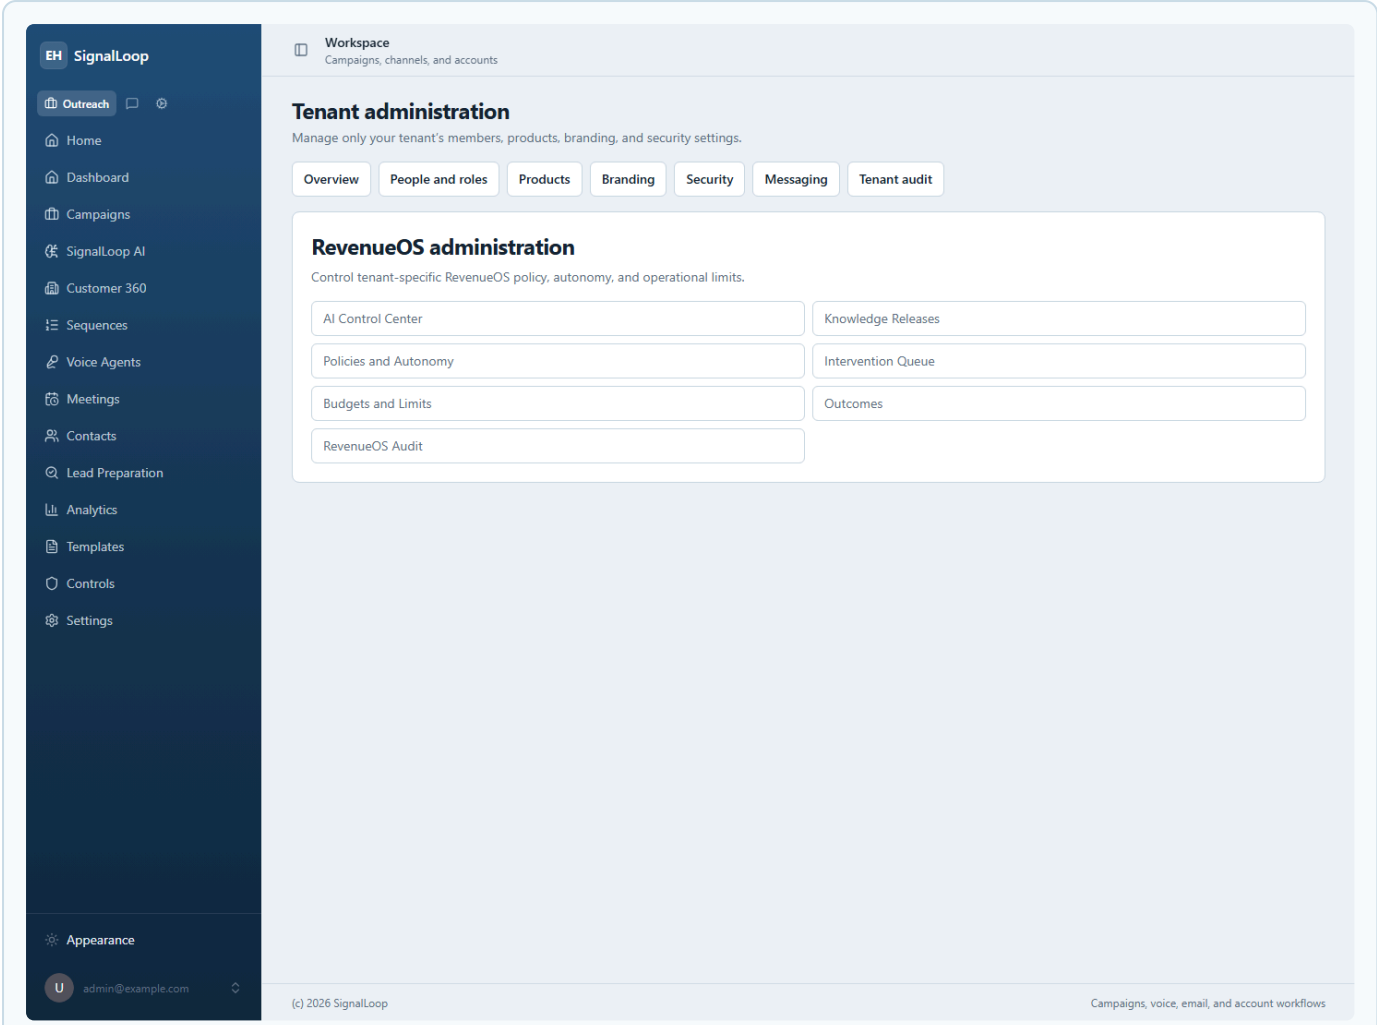

Tenant-scoped administration for the CommitArc product.

CommitArc administration

RevenueOS administration

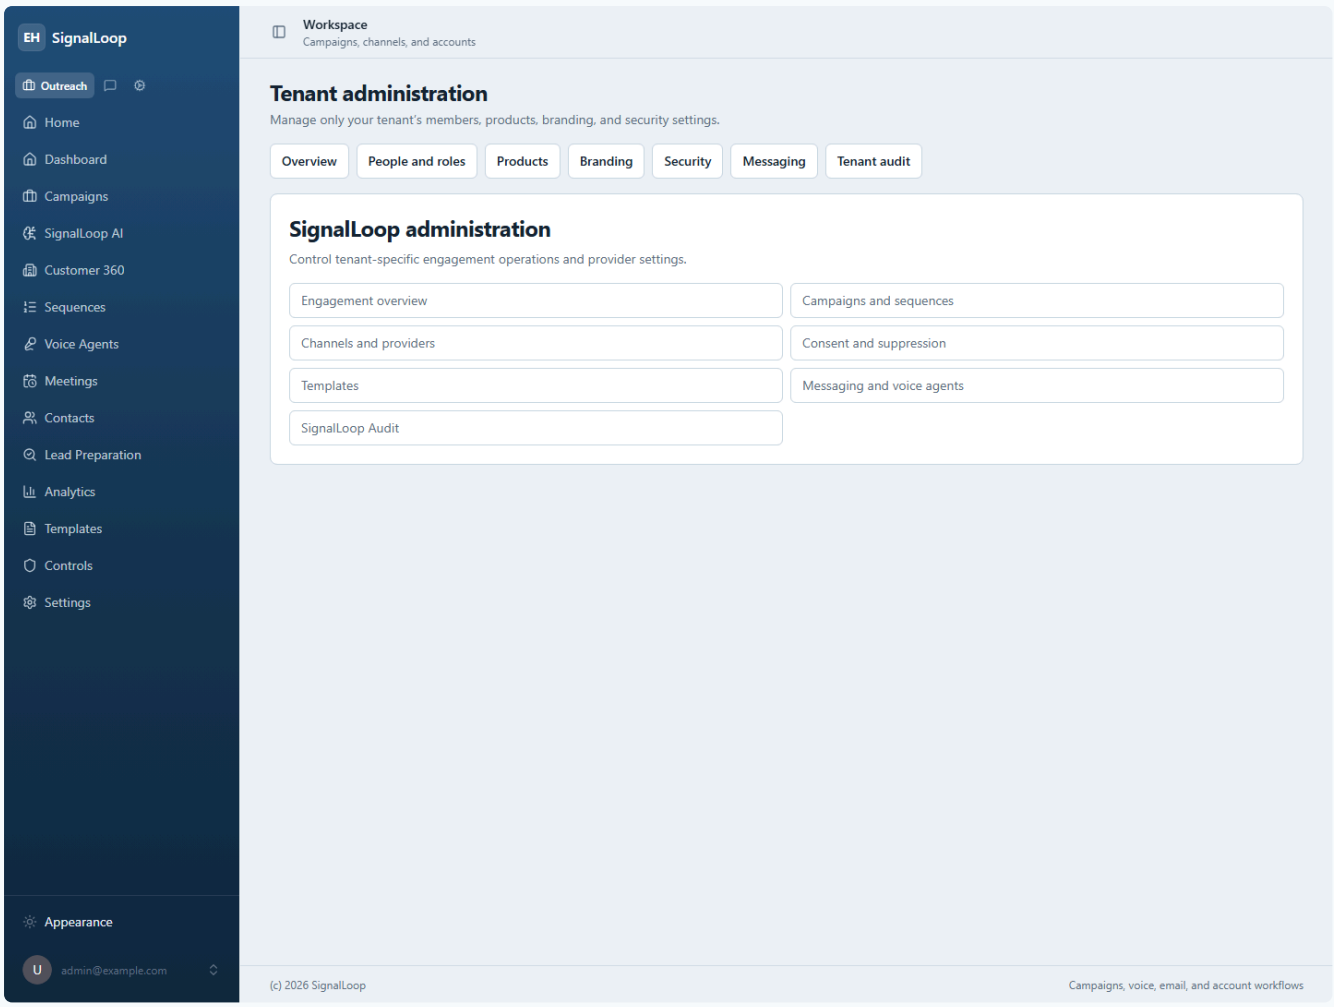

Tenant-scoped administration for the RevenueOS product.

RevenueOS administration

SignalLoop administration

Tenant-scoped administration for the SignalLoop product.

SignalLoop administration

Autonomous Commercial Agents

SignalLoop includes a unified **Commercial Agent Registry** that manages task-specific autonomous agents with strict slot enforcement, daily capacity metering, and governance policies:

- **Lead Discovery Agent (`LEAD_DISCOVERY`):** Executes automated firmographic searches, waterfall provider enrichment (Apollo, Clay, Burkettopti), 4-pillar AI scoring, and CRM contact promotion.
- **Lead Preparation Agent (`LEAD_PREPARATION`):** Evaluates contact pools against versioned scoring policies, manages atomic worker leases, and synthesizes actionable sales briefs.
- **Email Outreach Agent (`EMAIL_OUTREACH`):** Dispatches governed multi-touch sequences while strictly enforcing daily caps, quiet hours, and suppression rules.
- **Voice Outreach Agent (`VOICE_CONVERSATION`):** Executes AI-driven outbound phone calls with custom voice profiles, script compliance, and call transcription analysis.
- **Proposal Drafting Agent (`PROPOSAL_DRAFTING`):** Generates grounded commercial proposal drafts from conversation signals, pricing policies, and approved line items for human review or automated eCRM handoff.
- **Calendar Scheduler Agent (`CALENDAR_SCHEDULER`):** Calculates available meeting windows, issues verified booking links, and records durable booking receipts across provider APIs.
- **Revenue Intervention Agent (`REVENUE_INTERVENTION`):** Detects customer revenue risk and triggers governed corrective interventions across linked workspaces.

- **Chat Lead Capture Agent (`CHAT_LEAD_CAPTURE`):** Handles website visitor intake, knowledge-grounded Q&A, and direct lead capture in Messaging Hub.

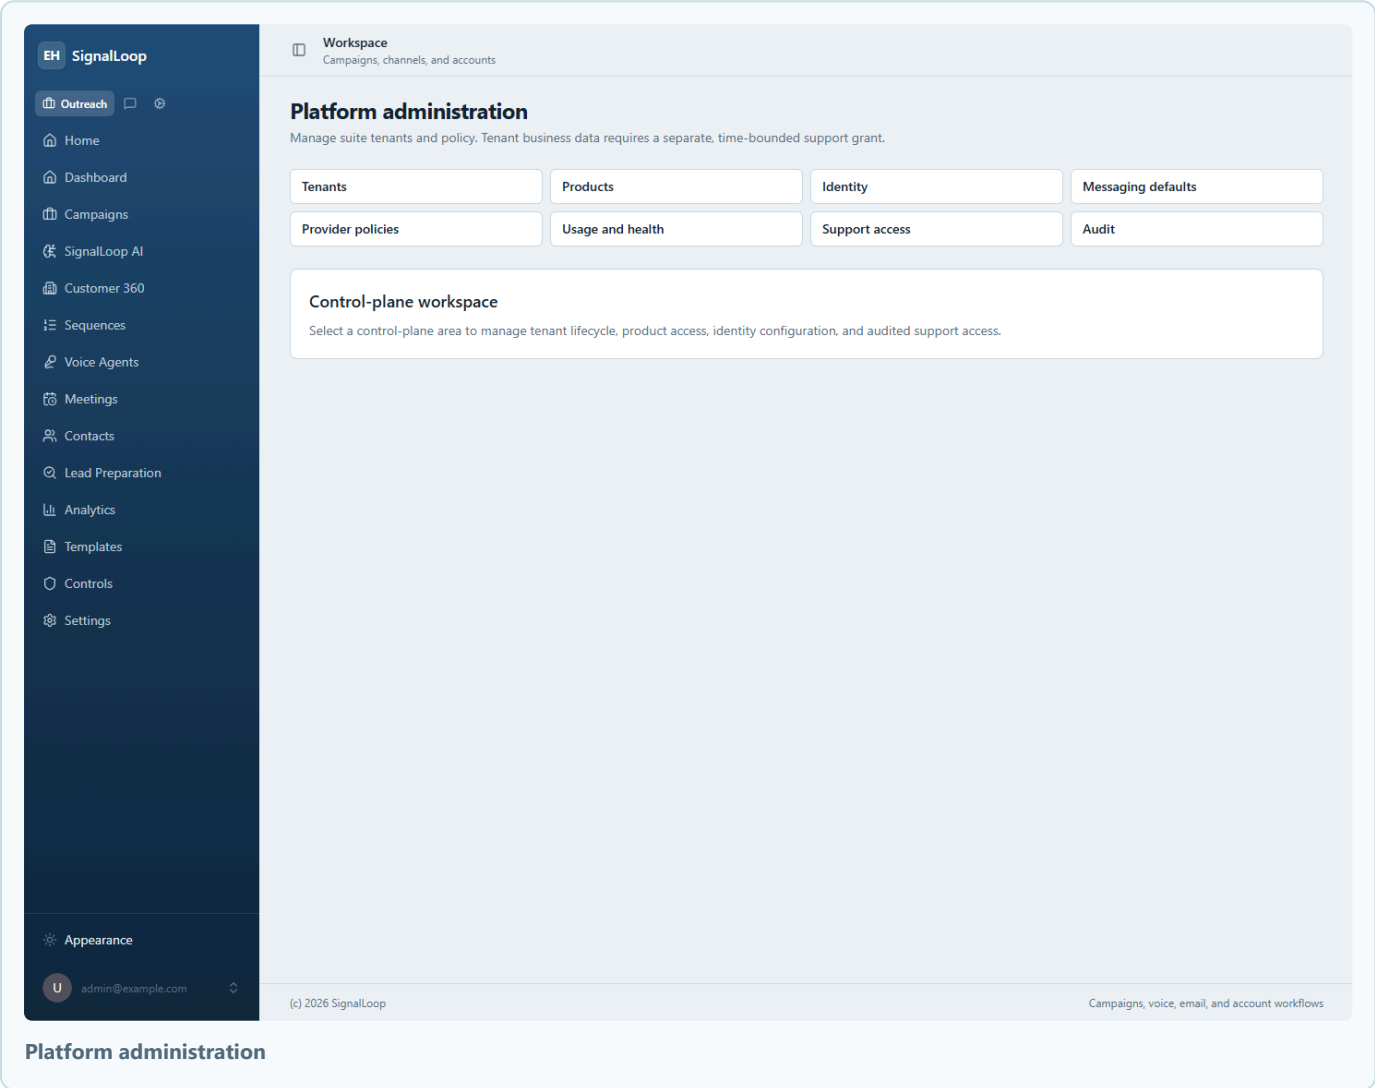

Each active agent deployment consumes one commercial slot, while throughput and provider consumption are metered transparently against tenant quotas.

Platform administration

Platform is the suite control plane for tenant lifecycle, products, identity, messaging defaults, provider policies, usage and health, support access, and audit. It sits outside the three tenant-scoped nav modes above and is reserved for platform administrators. Selecting a tenant here never grants access to its business data, and support access should be approved, time-bound, revocable, and audited.

Platform administration

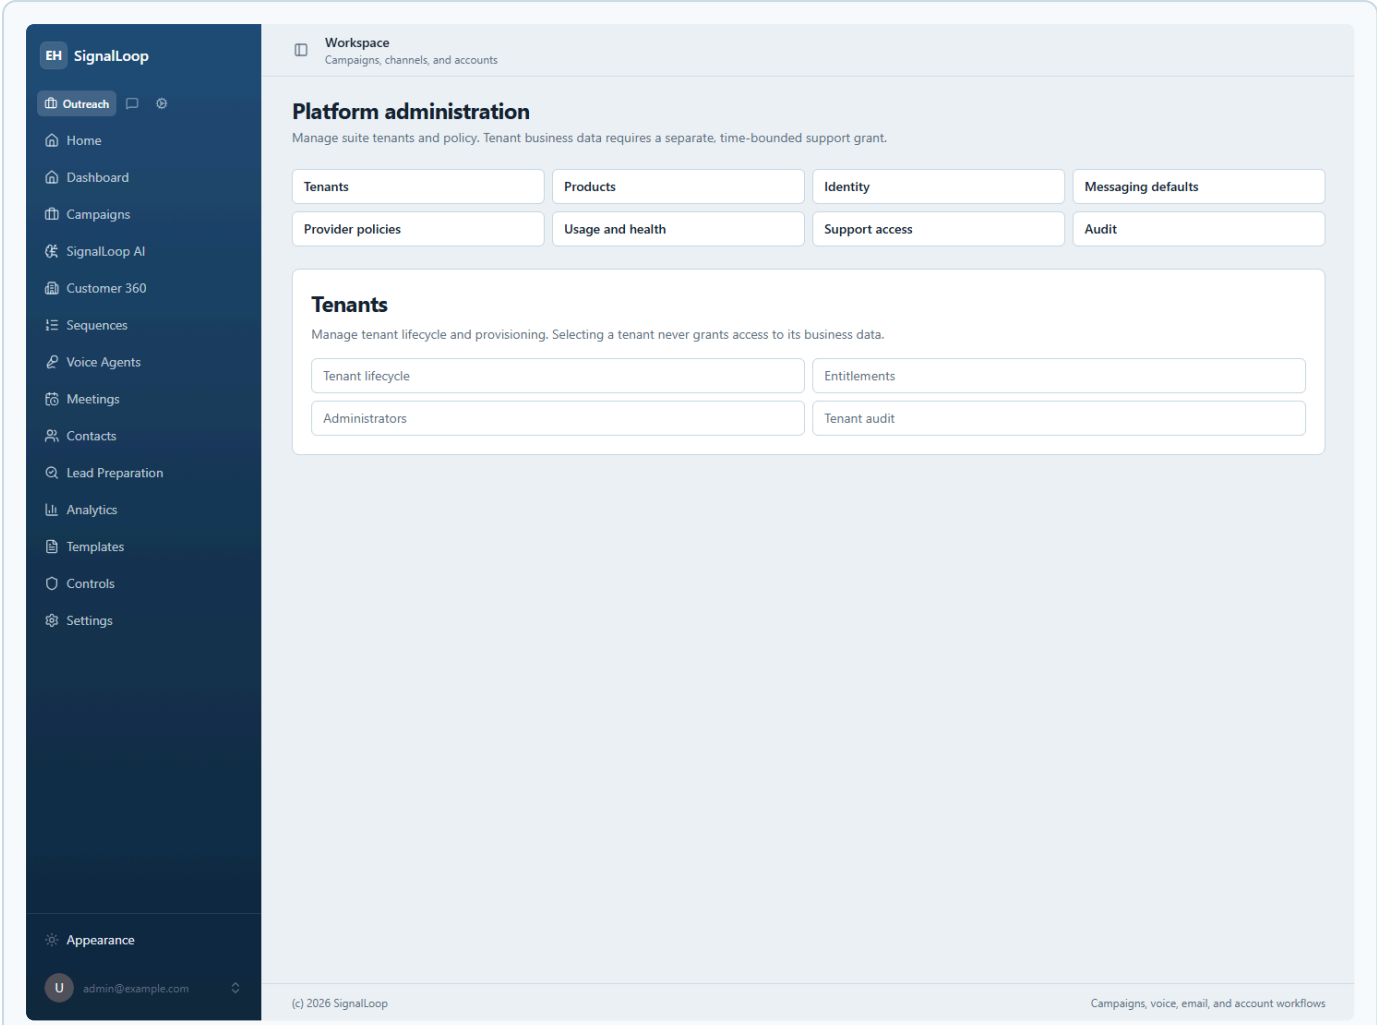

Landing screen for platform-wide administration.

Platform administration

Platform tenants

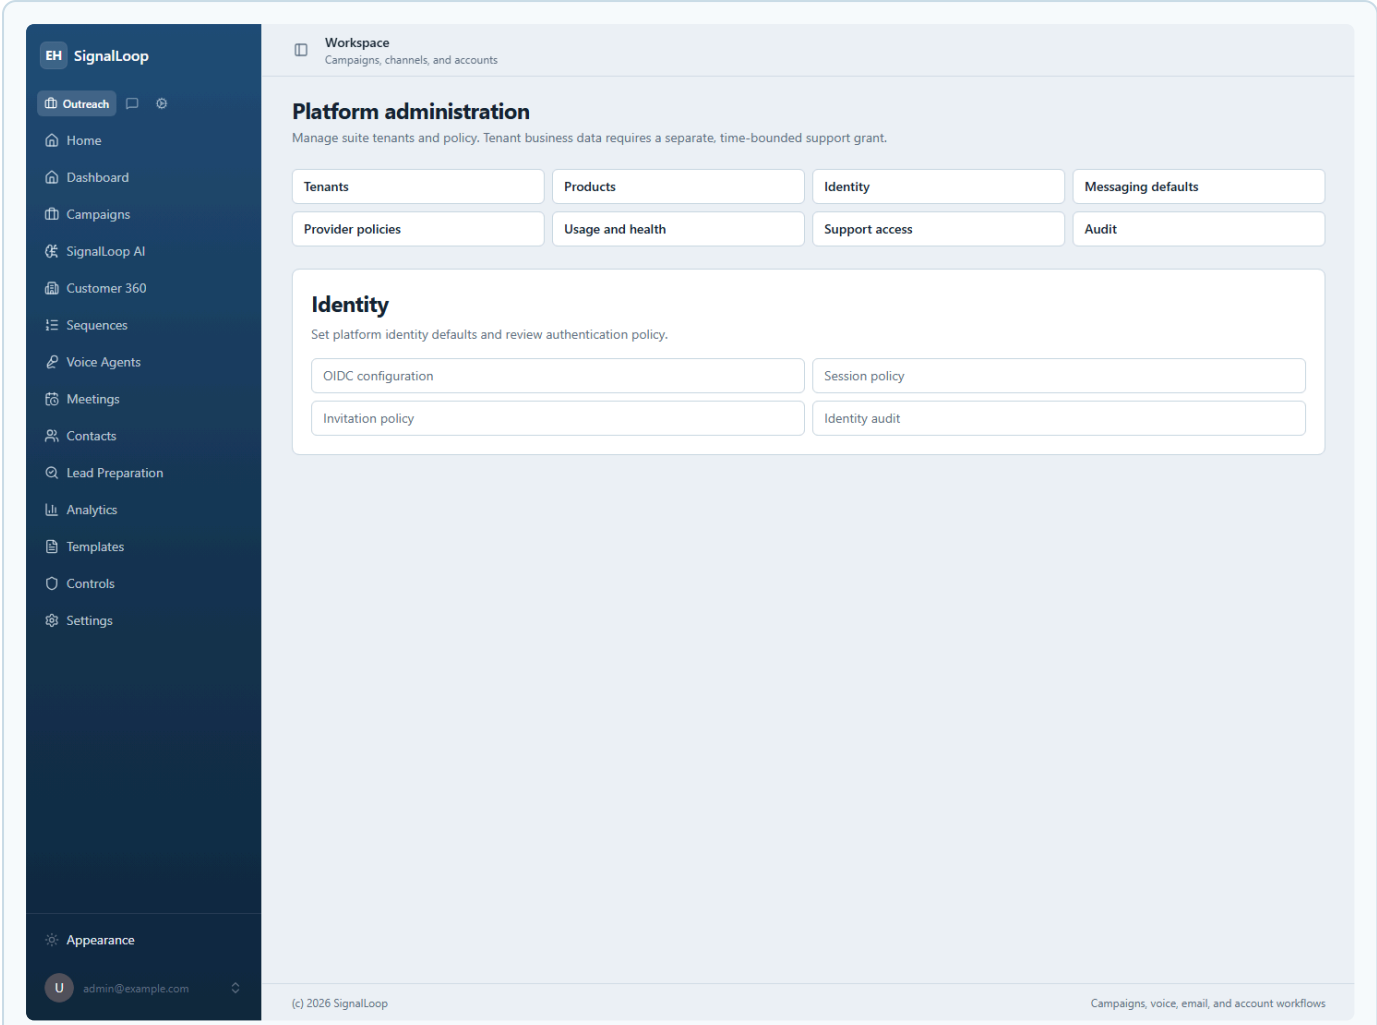

Manage tenant lifecycle across the platform.

Platform tenants

Platform identity

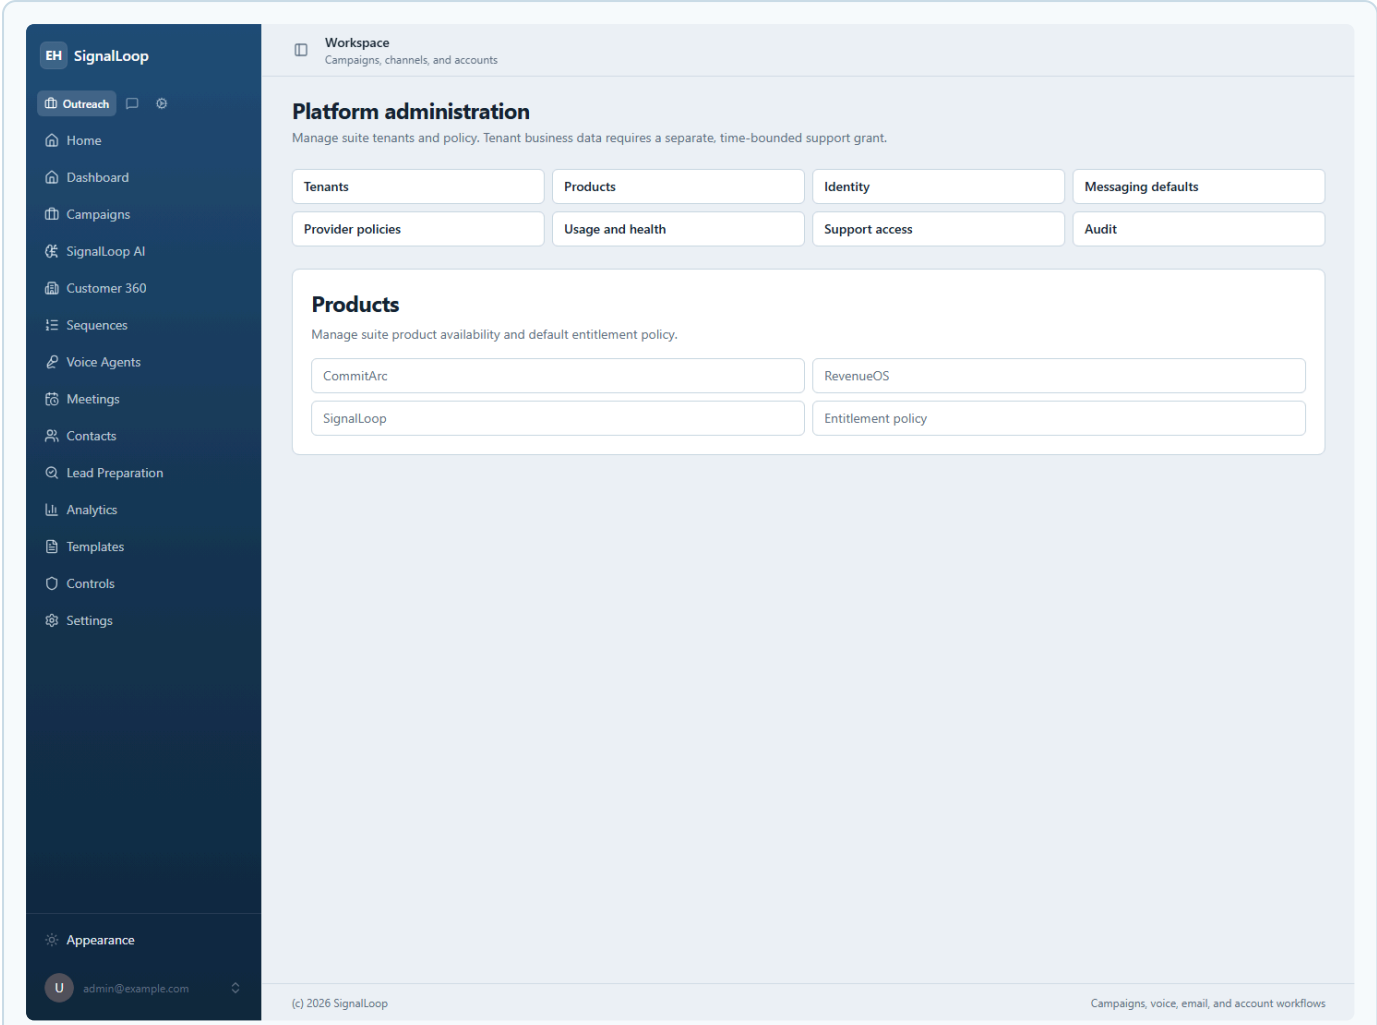

Manage platform identity configuration.

Platform identity

Platform products

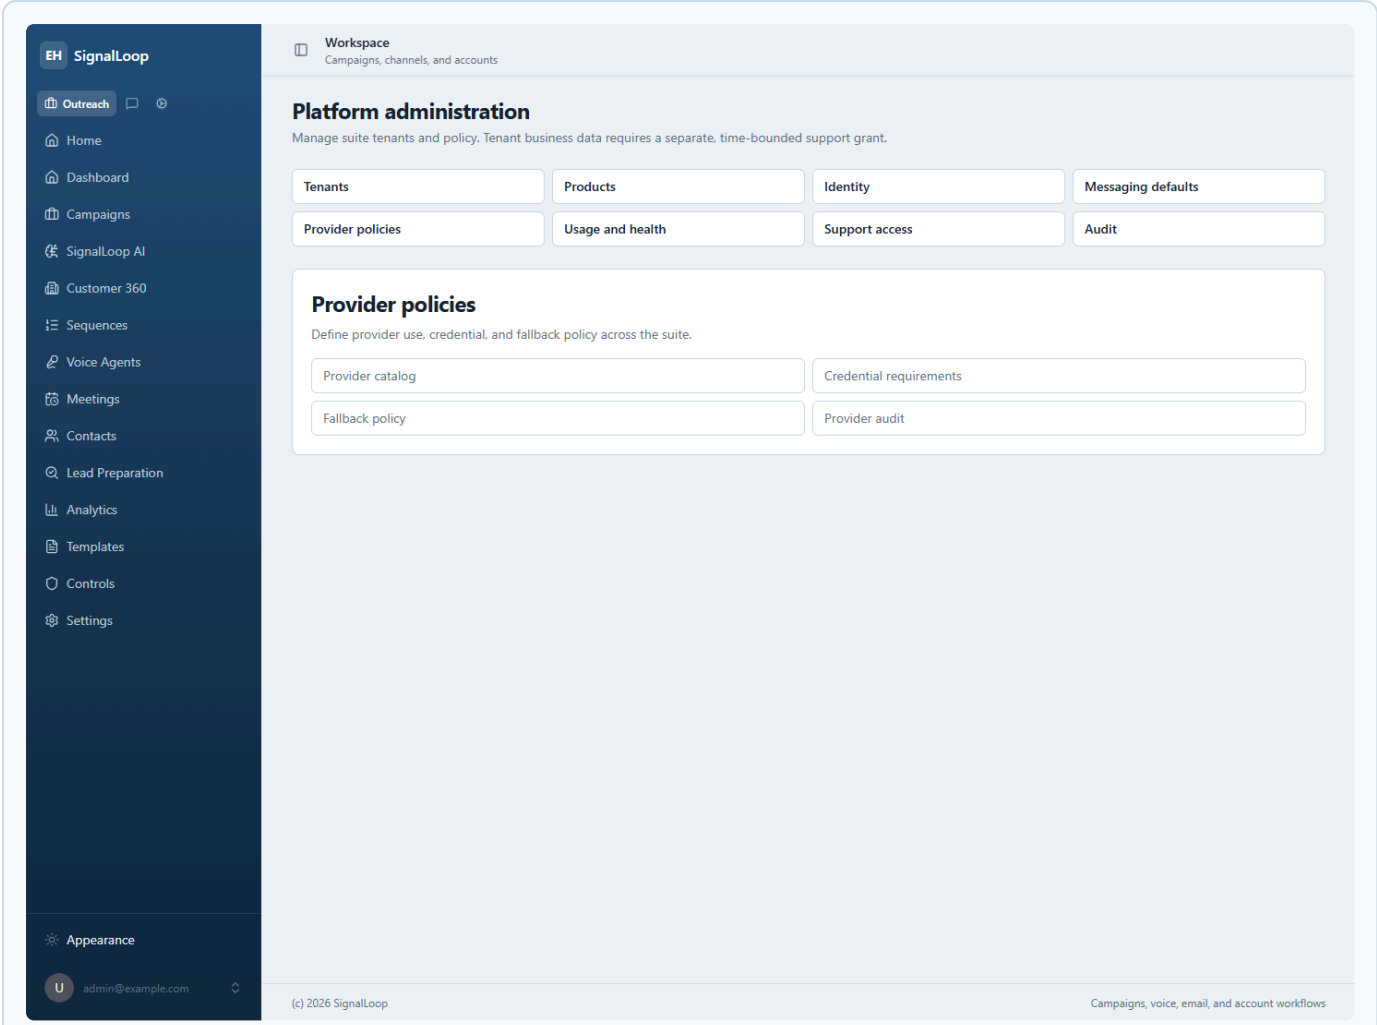

Manage product policy across the platform.

Platform products

Provider policies

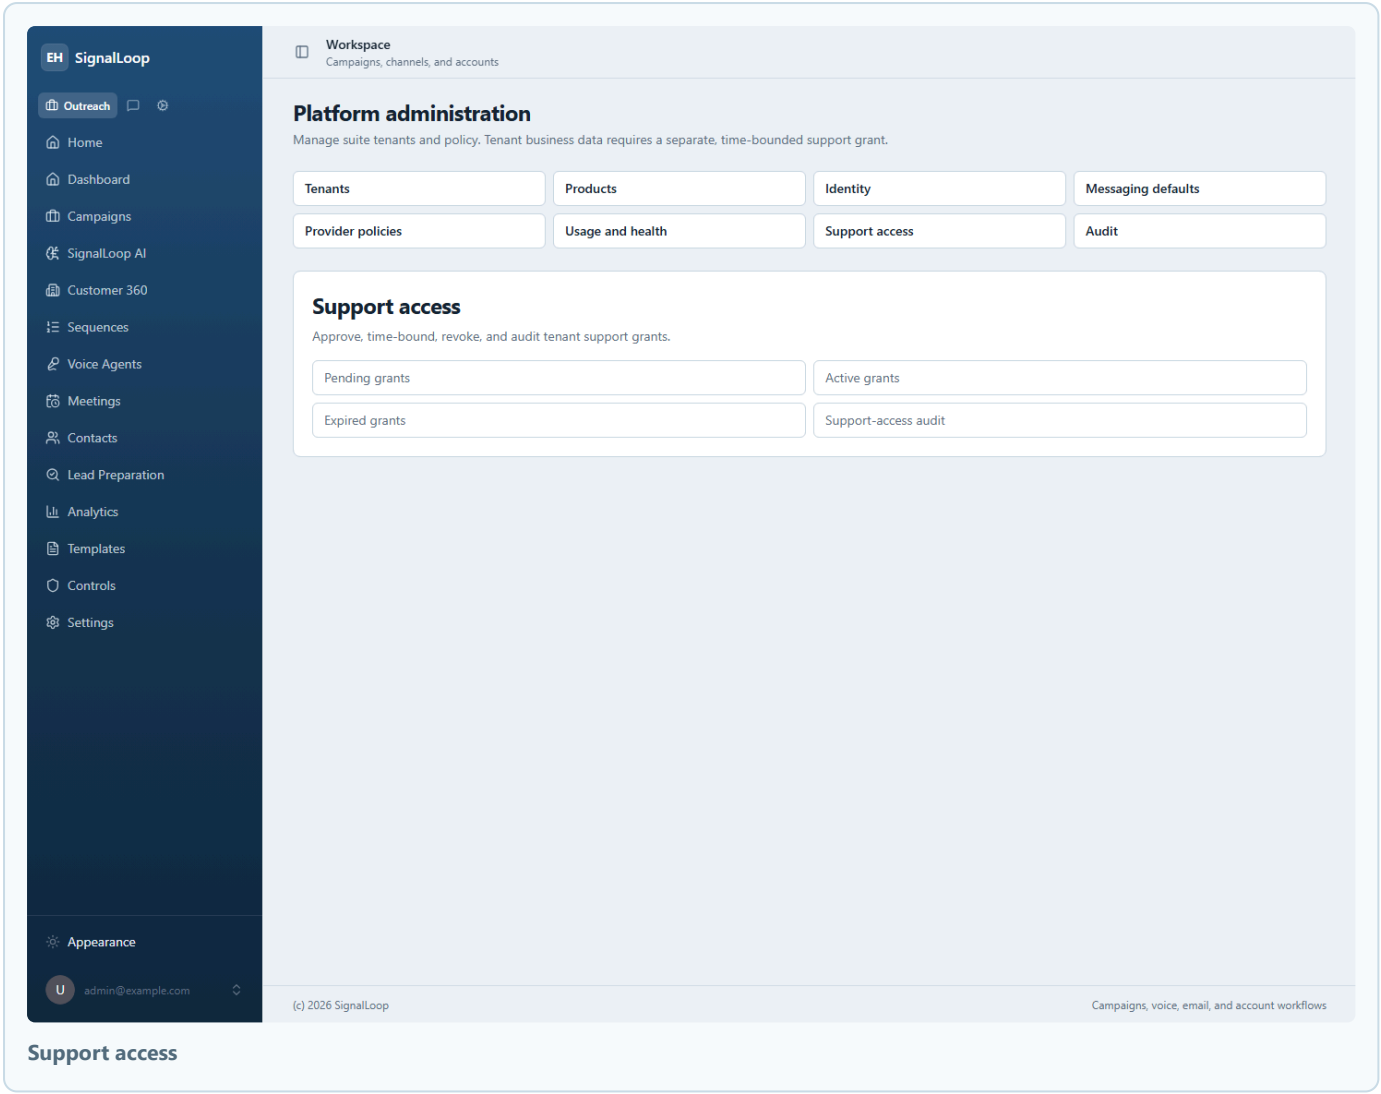

Manage provider policy defaults.

Provider policies

Support access

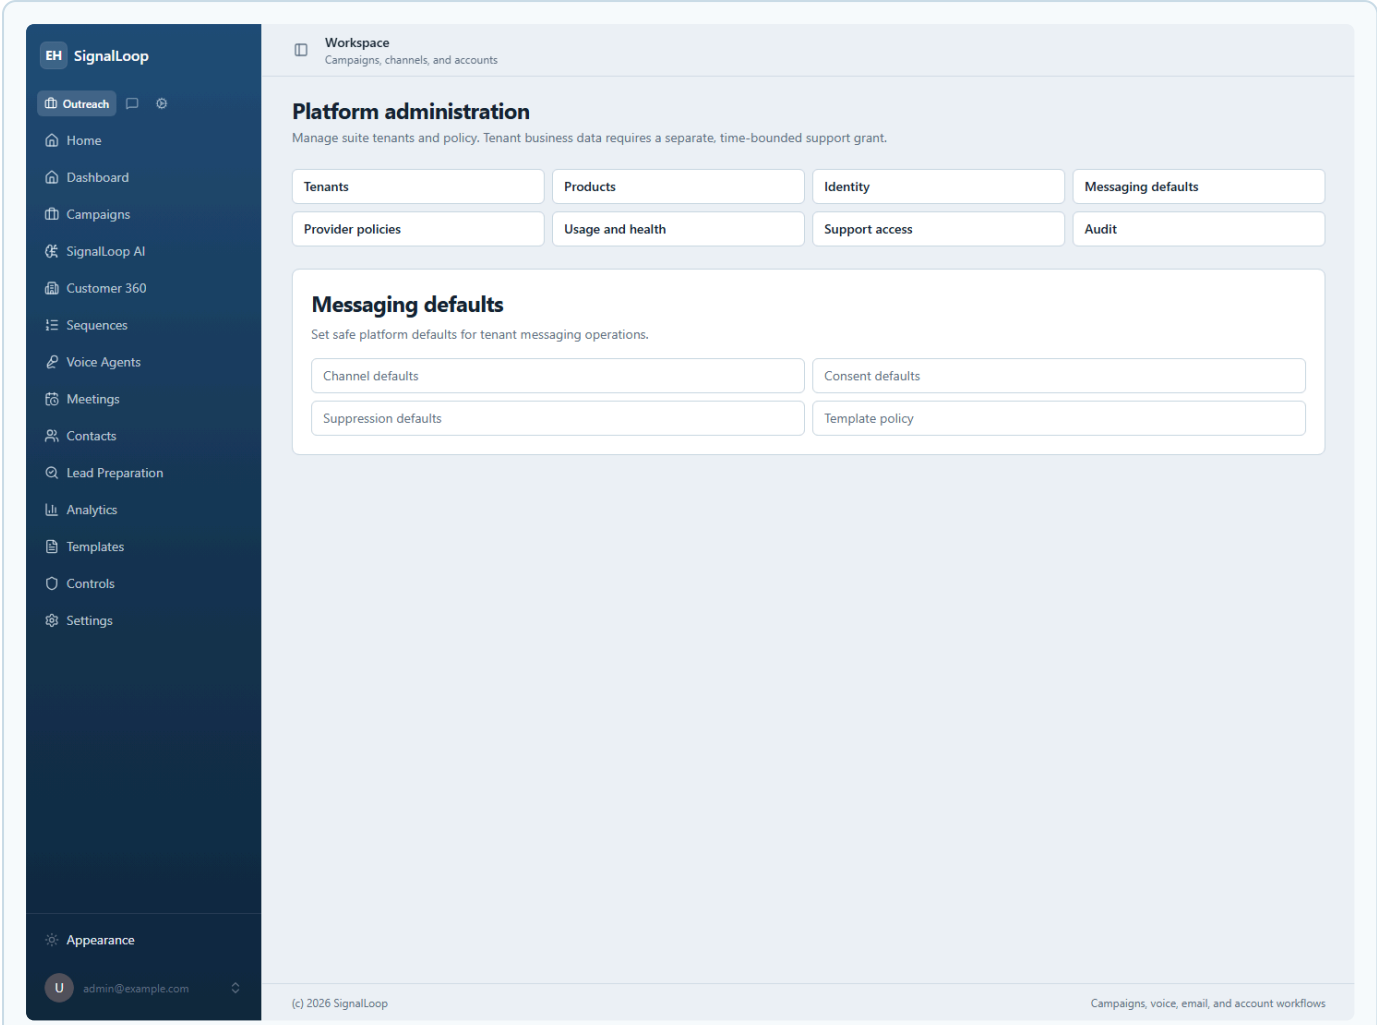

Grant and review time-bound, auditable support access to a tenant.

Support access

Messaging defaults

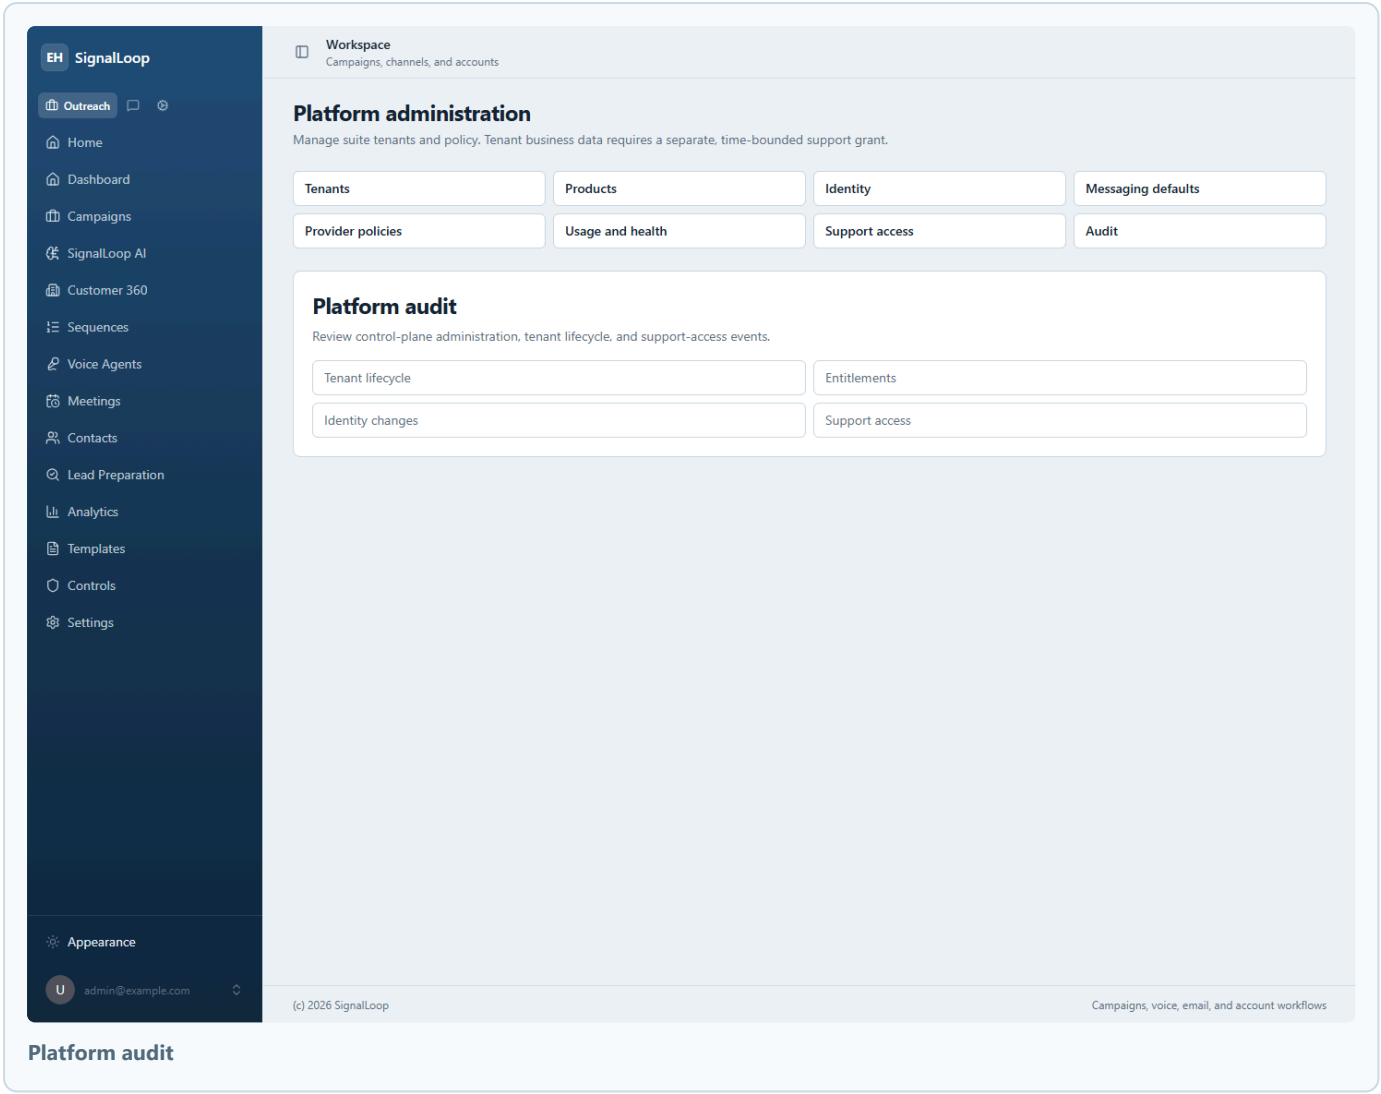

Manage platform-wide messaging defaults.

Messaging defaults

Platform audit

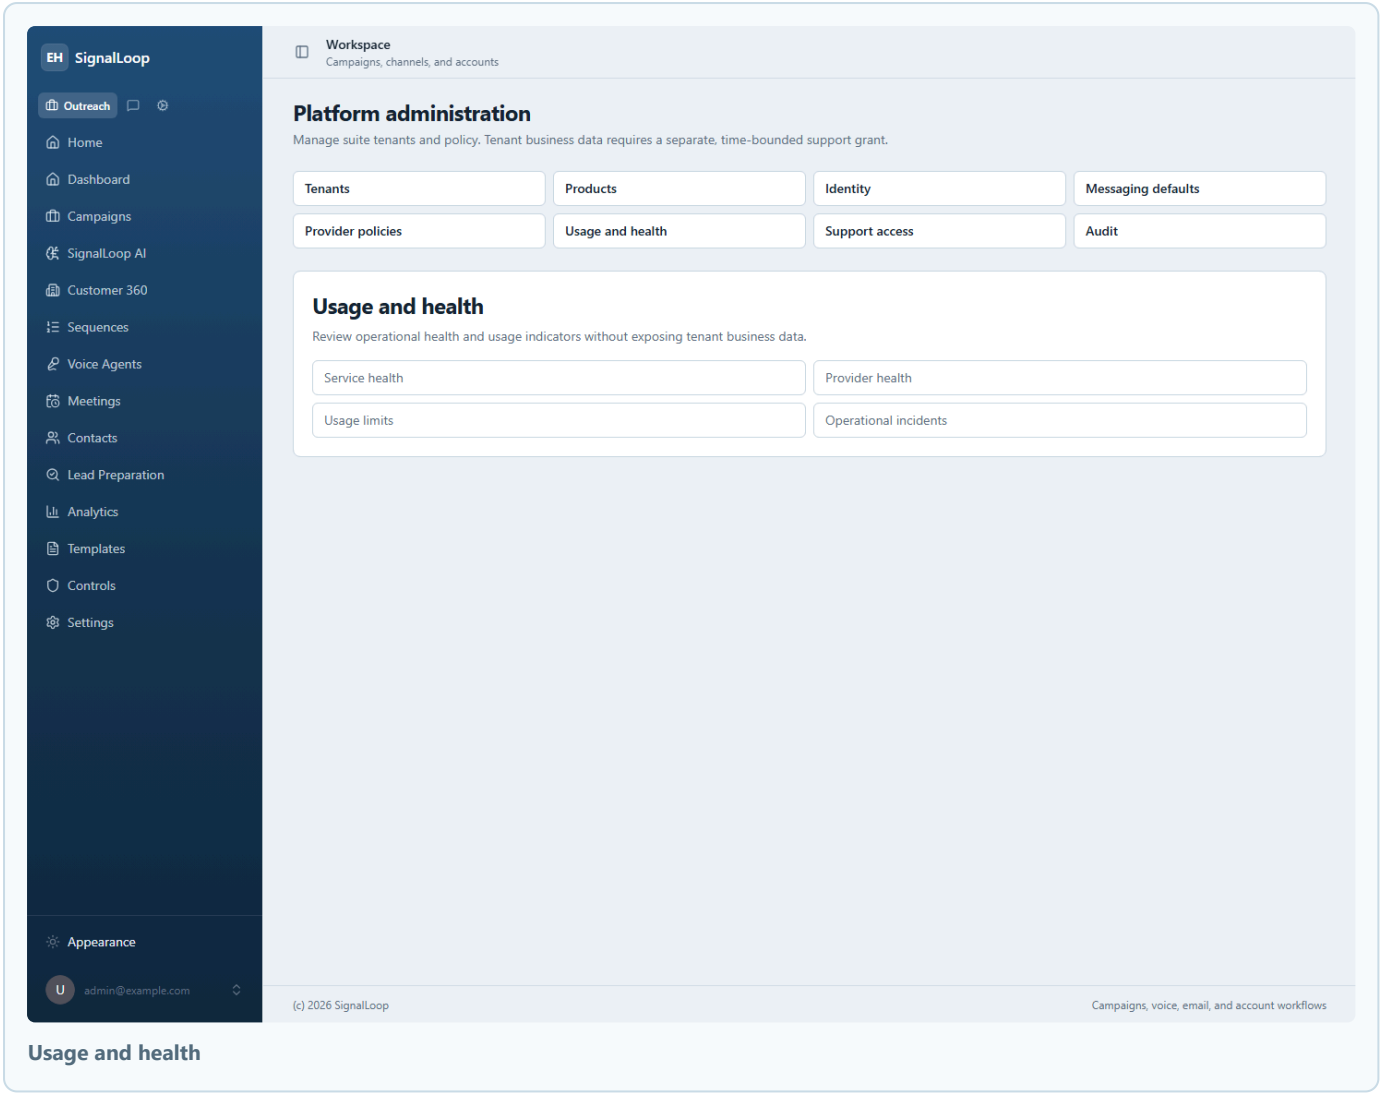

Review the platform-wide audit trail.

Platform audit

Usage and health

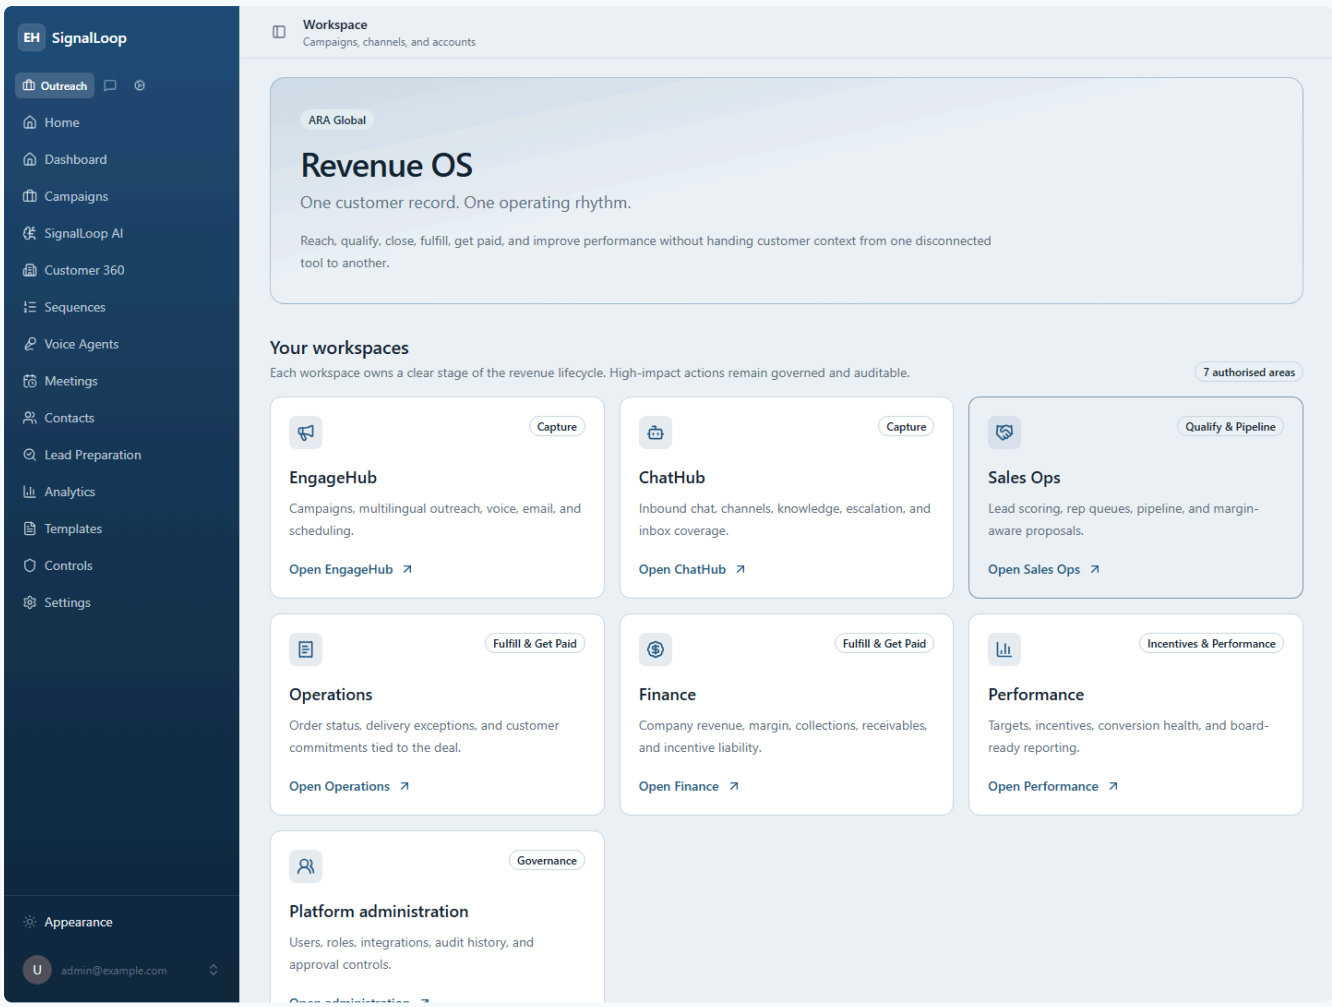

Review platform usage and health metrics.

Usage and health

Revenue OS

Revenue OS provides the cross-product operating view for EngageHub, ChatHub, Sales Ops, Operations, Finance, Performance, and Platform administration. Each linked product continues to enforce its own authorization controls.

Revenue OS

Troubleshooting

Expected workspace or menu is missing

Verify that you signed into the correct work account, then ask a tenant administrator to verify membership and role. A browser-stored workspace selection is never a substitute for server-side access checks.

A channel, campaign, or dashboard is empty

Check whether the workspace has business data, a connected provider, and running workers. For live delivery, verify provider activation, worker health, and delivery/audit evidence.

A page shows “Failed to fetch” or an error screen

Refresh once and confirm application health. If it persists, record the route, timestamp, and visible error for support. A browser shell loading is not proof that the screen data loaded.

Screenshot reference

Playwright captured 48 authenticated, 1440 × 1080 route screenshots in `screenshots/`, each shown once above in its place in the left-navigation walkthrough.

Area	Captures
Public access	`01-login` through `03-password-recovery`
Outreach workspace	`04-home` through `22-provider-settings`
Messaging Hub	`23-messaging-channels` through `27-messaging-settings`
Tenant administration	`28-admin` through `38-admin-signalloop`
Platform administration	`39-platform` through `47-platform-usage-health`
Revenue OS	`48-revenue-os`

Dynamic account and conversation-detail routes are not in the set because the verified workspace contained no account or conversation records.
